

Genus Ruppellia Swainson

798

Ruppellia Swainson, Nat. Hist. Animals,
vol. 2, p. 281, 1839. (Type Gobius
echinocephalus Rueppell, monotypic.)

(Rüppellia Wiedemann 1830 in Diptera
not involved.)

Ruppellia Swainson, op. cit., p. 184.
(~~Atypic~~. Type Gobius echinocephalus
Rueppell, virtually.)

Ruppellia Jordan and Richardson,
Philippine Journ. Sci., p. 47, 1910.
(Type Gobius echinocephalus Rueppell.)

Paragobiodon Bleeker, Nat. Tijds.
Dierk., vol. 4, p. 129, 1873. (Type
Gobius echinocephalus Rueppell,
monotypic.)

Body compressed. Head nearly globular, less than twice high as wide. Mouth very oblique, jaws subequal. Band of filiform teeth in each jaw, outer row enlarged. Lower jaw on both sides of symphysis at inner edge of dental band with 1 or 2 canines. Tongue rounded. No barbels. Nostrils in short tubes. Isthmus broad. Scales 22 to 24 in axial lateral series, strongly ctenoid. Head naked, covered with papillary appendices. Open pores above on head, behind eye and along edge of preopercle. Dorsal fins close together, first fin with 6 spines, second fin

with 9 or 10 rays. Anal like ⁸⁰⁰ second dorsal. Caudal rounded. Pectoral without free rays.

801

Rupellia echinocephala (Rüppell)

Gobius echinocephalus Rüppell, Atlas
Reise nördl. Afrika, Fische, p. 136, pl.
34, fig. 3, 1828 (type locality, Massawa,

Occas. Pap. Bishop Mus., vol. 4, no. 1, p.
84, 1906 (Shortland Island).

Gobiopterus modestus Regan, Trans. Linn.
Soc. London, ser. 2, vol. 12, p. 242, pl. 29,
fig. 1, 1908 (type locality, Chagos Archipelago,
Egmont and Salomon).

Ruppellia lacunicola Kendall and
Goldsborough, Mem. Mus. Comp. Zool.,
vol. 26, p. 318, pl. 6, fig. 1, 1911 (type
locality, Fakarava, Taumotu).

810

Paragobiodon kerri H. M. Smith, Proc.
U. S. Nat. Mus., vol. 79, art. 7, p. 42,
fig. 20, 1931 (type locality, Koh Tao,
Gulf of Siam).

811

Depth 3 to 4; head $2\frac{7}{8}$ to $4\frac{3}{4}$,
width $1\frac{1}{8}$ to $1\frac{1}{3}$, snout 3 to
4 in head; eye $3\frac{2}{3}$ to 5, greater
than snout to $1\frac{3}{5}$ in snout,
 $1\frac{1}{5}$ to $1\frac{1}{2}$ in interorbital;
maxillary reaches opposite front
eye edge or $\frac{1}{5}$ in eye, length
 $2\frac{1}{4}$ to 3 in head; mouth
small, subvertical or greatly
inclined, begins in front little
below level of lower eye edge,
lower broad swollen mandible
usually protruded in front;
each jaw with band of villiform
teeth, anterior outer series
little enlarged, below pair
of canines behind symphysis
and 2 or 3 smaller lateral ones;
tongue convex in front; inter-
orbital $2\frac{2}{3}$ to $4\frac{3}{4}$ in head,
little convex.

Scales 23 or 24 in lateral
series; 10 transversely between

front of second dorsal and ^{8/12} anal. Head, predorsal, prepectoral region, chest and breast naked; head with small ^{flabby} prickles or papillae, sometimes hair like, and variously scattered or massed, as sometimes densely so, on predorsal or under surface of head, or may even extend on ventral fins. Scales on body ctenoid.

D. VI, I, 9 or 10, third spine 2 to $2\frac{1}{3}$ in total head length second dorsal height $1\frac{3}{5}$ to $1\frac{3}{4}$; A. I, 9, fin height $1\frac{4}{5}$ to $1\frac{7}{8}$; caudal $1\frac{1}{5}$ to $1\frac{2}{5}$, convex behind; least depth of caudal peduncle $1\frac{4}{5}$ to $1\frac{7}{8}$; pectoral 1 to $1\frac{1}{8}$, rays 16 to 19; ventral rays I, 5, fin $1\frac{1}{3}$ to $1\frac{2}{5}$ in head. Coloration variable, black, brown, green, yellow or pink. Body often dark and head pale.

813
sometimes head and body either
uniformly dark or light, or
sometimes only ventrals blackish.

Red Sea, Mauritius, Madagascar,
Chagos Archipelago, Andamans,
Nicobars, East Indies, Siam,
Philippines, Rin Kiu, China,
Queensland, Melanesia, Micronesia,
Polynesia.

One example. Bubuian Island, Jolo.
Dynamite. February 14, 1908. Length
17 mm.

One example. Jolo, shore seine. March
6, 1908. Length 36 mm.

U. S. N. M., no. 15113. Samoa.
Steinberger. Length 13 to 27 mm.
Six examples.

U. S. N. M., no. 52244. Apia, Samoa.
Bureau of Fisheries. Length 12 to
24 mm. Five examples.

U. S. N. M., no. 66005. Borabora,
Society Islands. Albatross.
Collection 1899-1900. Length 22 mm.

U. S. N. M., no. 82939. Fiji or
Samoa. Wilkes Exploring Expedition.

U. S. N. M., no. 82955. Fiji or
Samoa. Wilkes Exploring Expedition.

U. S. N. M., no. 52254. Apia, Samoa.
Bureau of Fisheries. Length 27 to
32 mm. Six examples. As Para-
gobiodon xanthozoma.

Genus Gobius Linnaeus

Gobius Linnaeus, Syst. Nat., ed. 10, pt. 1, p. 262, 1758. (Type Gobius niger Linnaeus, designated by Bleeker, Arch. Néerl. Sci. Nat. Harlem, vol. 9, p. 316, 1874.)

Gobio Klein, Gesellsch. Schauplatz, vol. 7, p. 178, 1779. (Type Gobius niger Linnaeus) (inadmissible)

Priolepis Valenciennes, Hist. Nat. Poiss., vol. 12, p. 67, 1837. (Type Priolepis mica (Ehrenberg) Valenciennes, designated by Whitley, Ctenogobius Gill, Ann. Lye. Nat. Hist. New York, vol. 6, p. 374, 1858. (Type Ctenogobius fasciatus Gill, orthotypic.)

Rhinogobius Gill, Proc. Acad. Nat. Sci. Philadelphia, p. 145, 1859 (1860). (Type Rhinogobius similis Gill, orthotypic.)

Australian Zoologist, vol. 6, p. 2, p. 123, Jan. 14, 1930.

Pomatoschistus Gill, op. cit., vol. 15, p. 263, 1863. (Type Gobius minutus Linnaeus, orthotypic.)

Settenosteus Gill, op. cit., p. 263. (Type Gobius quadrimaculatus Valenciennes, orthotypic.)

Coryphopterus Gill, op. cit., p. 263. (Type Coryphopterus glaucofraenum Gill, orthotypic.)

Merogobius Bleeker, Arch. Néerl. Sci. Nat., Harlem, vol. 9, p. 317, 1874. (Type Gobius batrachocephalus Pallas, orthotypic.)

Gnatholepis Bleeker, op. cit., p. 318. (Type Gobius anjerensis Bleeker, orthotypic.)

Acentrogobius Bleeker, op. cit., p. 321. (Type Gobius chlorostigma Bleeker, orthotypic.)

817

Porogobius Bleeker, op. cit., p. 321.
(Type Gobius schlegelii B. Günther,
orthotypic.)

Zanogobius Bleeker, op. cit., p. 323.
(Type Gobius semifasciatus Kner,
orthotypic.)

Lebetus Winther, Naturhist. Tidsskr.,
ser. 3, vol. 11, p. 49, 1877. (Type Gobius
scorpioides Collett, monotypic.)

Lebetus (not Filippi = 1861-62) Jordan, Journal of Fishes,
pt. 4, p. 487, Aug. 15, 1920. (Type Gobius scorpioides Collett.)

Bathygobius Bleeker, Arch. Néerl.
Sci. Nat. Harlem, vol. 13, p. 54, 1878.

(Type Gobius nebulopunctatus
Valenciennes = Gobius fuscus
Rüppell, monotypic.)

Caffrogobius Vuitt, Overs. Vet.
Akad. Förh. Stockholm, p. 540, 1899.
(Type Gobius nudiceps Valenciennes,
monotypic.)

219

Mugilogobius Smitt, op. cit., p. 543.
(Atypic. Type Ctenogobius abei
Jordan and Snyder, designated
by Jordan, Genera of Fishes,
pt. 4, p. 487, 1920.)

Maipo Smitt, op. cit., p. 543. (Type
Gobius soporator Valenciennes,
monotypic.)

Proterorhinus Smitt, op. cit., p. 544.
(Type Gobius marmoratus Pallas,
monotypic.)

Eichwaldia ^(not) Smitt, op. cit., p. 545.
(Type Gobius caspicus Eichwald,
monotypic.)

Hazeus Jordan and Snyder, Proc.
U. S. Nat. Mus., vol. 24, p. 51, Sep. 25,
1901. (Type Hazeus otakii Jordan
and Snyder, monotypic.)

Chlamydes Jenkins, Bull. U.S. Fish Comm., vol. 22, p. 503, Sep. 23, 1903.
(Type Chlamydes laticeps Jenkins, monotypic.)

Quisquilius Jordan and Evermann, Bull. U.S. Fish Comm., vol. 22, p. 203, 1902 (April 11, 1903). (Type Quisquilius eugenius Jordan and Evermann, monotypic.)

Creisson Jordan and Seale, Bull. Bur. Fisher., vol. 26, p. 43, 1906 (1907). (Type Creisson validus Jordan and Seale, orthotypic.)

Drombus Jordan and Seale, Proc. U.S. Nat. Mus., vol. 28, p. 797, 1905. (Type Drombus palachyi Jordan and Seale, monotypic.)

Vaimosa Jordan and Seale, Bull. Bur. Fisher., vol. 25, p. 395, Dec. 15, 1906. (Type Vaimosa fontinalis Jordan and Seale, orthotypic.)

Epyrias Jordan and Seale, op. cit., p. 405. (Type Epyrias punitangoides Bleeker, monotypic.)

824

Pleurogobius Seale, Philippine
Journ. Sci., vol. 4, no. 6, p. 536, 1906.
(Type Pleurogobius boulengeri
Seale, monotypic) (no generic
description).

Ulcigobius Fowler, Proc. Acad. Nat.
Sci. Philadelphia, vol. 70, p. 69, 1918.
(Type Drambus maculipinnis
Fowler, orthotypic.)

Opua E. K. Jordan, Proc. U. S. Nat.
Mus., vol. 66, ^{part 33,} p. 36, 1926. (Type
Opua nephodes E. K. Jordan, orthotypic.)

Tubugobius Herre, Gobies of Philippines,
p. 119, 1927. (Type Rhinogobius
carpenteri Seale, orthotypic.)

Pandaka Herre, op. cit., p. 196. (Type
Pandaka pusilla Herre, orthotypic.)

Cingulogobius Herre, op. cit., p. 201. (Type
Pleurogobius boulengeri Seale, orthotypic.)

822

Tamanaka Herre, op. cit., p. 220. (Type
Tamanaka sintensis Herre, orthotypic.)

Amoya Herre, op. cit., p. 225. (Type
Gobius brevirostris Günther, orthotypic.)

Gobiusculus Duncker, Tierwelt Nord
und Ostsee, p. 123, 1928. (Type
Gobius flavescens Fabricius.)

Lesneuria ~~Herre~~

Duncker, op. cit., p. 124. (Type Gobius
lesneuri Risso.)

Knipovitschia Igin, Rep. Astrakhan
Sci. Fishery Vta., vol. 6, no. 3, ~~1928~~
1928. (Type Gobius longicaudatus
var. a-b Kessler.)

Hyracanogobius Igin, op. cit. (Type
Hyracanogobius bergi Igin =
Gobius longicaudatus var. a-b. Kessler.)

Berowra Whitley, Records Austral.
Mus., vol. 16, Pt. 4, p. 224, March 28,
1928. (Type Gobius lidwilli Mc
Culloch, orthotypic.)

Mesogobius Whitley, Proc. Roy.
Soc. Tasmania, p. 62, 1928 (Jan.
16, 1929). (Type Gobius hinsbyi
McCulloch and Ogilby, orthotypic.)

Berowra Whitley, Records Austral.

Mus., vol. 16, p. 224, 1928. (Type ^{March 28,}

Gobius Lidwilli McCulloch, orthotypic.)

Mesogobius Whitley, Proc. Roy. Soc. Tasmania, 1928, p. 62, Jan. 16, 1929. (Type Gobius hinsbyi McCulloch and Ogilby, orthotypic.)

Fusigobius Whitley, op. cit., vol. 18, pt. 2, p. 122, Jan. 14, 1930. (Type Gobius neophytus

Günther, orthotypic.)

Paranigobius Whitley, Australian Zoologist, vol. 6, pt. 2, p. 122, Jan. 14, 1930. (Type Gobius lateralis Macleay, orthotypic.)

Arenigobius Whitley, Austral. Zoologist, vol. 6, pt. 2, p. 122, Jan. 14, 1930. (Type Gobius

bifrenatus Kner, orthotypic.)

Chlamydogobius Whitley, op. cit., p. 122, Jan. 14, 1930. (Type

Gobius eximius Gretz, orthotypic.)

Parwigobius Whitley, op. cit., p. 122. (Type

Parwigobius immemitus Whitley =

Gobius flavescens (not Schneider) de Vis, 1881, orthotypic.)

Astreogobius Whitley, op. cit., p. 122, Jan. 14, 1930. (Type Gillichthys australis Ogilby, orthotypic.)

Eichwaldiella Whitley, op. cit., p. 123.

(Type Gobius caspicus Eichwald.)

Eichwaldiella Whitley proposed to

replace Eichwaldia Smith.

Butigobius Whitley, Australian Zoologist, vol. 6, pt. 2, p. 123, Jan. 14, 1930. (Type "Gobius scorpioides Smith" = Gobius scorpioides Collett, orthotypic.)

825

Cabotia De Buen, Trab. Inst. Esp.
Oceanogr., vol. 5, p. 18, 1930. (Type
Cabotia schmidtii De Buen.)

Istigobius Whitley, Fish. Great Barrier
Reef Exped., 1928-29, Sci. Rep. vol. 4,
no. 9, p. 301, 1932. (Type Gobius
maculatus Castelnau, orthotypic.)

Isthmogobius (Bleeker) Koumans,
Prelim. Rev. Gobioid Fish., p. 86, 1931.
(Type Gobius baliurus Valenciennes,
orthotypic.)

Chlamydogobius Whitley,

826

Ellogobius Whitley, Records Austral.
Mus., vol. 19, no. 1, p. 92, Aug. 2, 1933.
(Type Gobius stigmatus De
Vis, orthotypic.)

Lizagobius Whitley, op. cit., p. 93,
Aug. 2, 1933. (Type rugilobius
galwayi Mc Culloch and Waite,
orthotypic.)

Genus Psammogobius J. L. B. Smith.

Psammogobius J. L. B. Smith, Records
Albany Mus., vol. 4, pt. 2, p. 215, May
23, 1935. (Type Psammogobius
kyronaensis J. L. B. Smith, ortho-
typic.)

Differs from Gobius only in the
very wide and unrestricted
gill opening, the gill-membranes
completely free from the isthmus.
Ventrals elongate, reaching
anal base or beyond.

Paroxyranchthys sagittula (Günther)

Ectenogobius sagittula Günther,

828

Body oblong or elongate, compressed behind. Head oblong, more or less depressed, abruptly widened behind eyes. Snout usually broadly rounded, with convex profile. Eyes variably large or small, elevated, advanced or in front half of head, close together. Mouth moderate, variously inclined. Teeth in jaws only, conic, in several series, outer row enlarged. Lips variously fringed or entire. Gill opening lateral. Isthmus wide. Shoulder girdle without fleshy lips or papillae. Scales moderate, ~~or~~ ctenoid, variously forward on head and predorsal. Prepectoral region, chest and breast variously scaled or naked. Two dorsals, front

829

fin with about 6 rather weak
spines. Caudal usually obtuse.
Pectorals well developed,
upper rays with confluent
membrane, sometimes free,
detached and silk like.
Ventrals large or small, com-
pletely united, not attached
to belly.

A large genus with very
numerous species at here I
understood. Many are little
known, imperfectly described,
or when figured often un-
satisfactory, therefore their
relationship uncertain. I
have thus grouped a large
number below in only alphabeti-
cal sequence until they may be
better understood known.

Gobius abascantus (Whitley)

Ellogobius abascantus Whitley,
Records Austral. Mus., vol. 20, No. 1,
p. 17, fig. 4, May 15, 1937 (type locality,
A very shallow brackish creek
near the Hanging Rock camping
grounds at Batherman's Bay, New
South Wales).

Depth $6 \frac{3}{4}$; head $3 \frac{3}{4}$. Snout $4 \frac{1}{2}$ in head; eye $4 \frac{1}{2}$, equals snout; maxillary reaches $\frac{3}{4}$ in eye, length $2 \frac{3}{4}$ in head; mouth low, terminal, but little inclined, lower jaw slightly shorter; lips sinuate; each jaw with band of fine villiform teeth; tongue with very shallow notch anteriorly; interorbital broad, sunken. Gill openings separated by wide isthmus.

Scales 52 to 60 in lateral series; 15 transversely. Head naked, mucous papillae reduced or absent. Predorsal, breast and prepectoral regions naked. Body covered with cycloid scales, small anteriorly, larger on caudal peduncle.

D. VI-8, third spine $2 \frac{2}{5}$ in head, fifth ray $2 \frac{1}{5}$; A. 10, eighth ray $2 \frac{1}{5}$; caudal $1 \frac{1}{6}$, convex

835b

behind; least depth of caudal peduncle $2\frac{1}{4}$; pectoral $1\frac{2}{5}$, rays 16, none detached; ventral 2 in head, rays $\overline{1}, 5$, united, with frenum, free from body. Anal papilla half of eye.

Very pale dirty yellow or cream, overlain by numerous indistinct and broken sooty blotches on upper half of fish. Reticulated pattern of fuscous chromatophores behind eye. Dark blotch on opercle, one on hind dorsal spines and most conspicuous of all an irregular blackish blotch at base of caudal. Most fin rays with double series of fine black dots. Pale orange smudge along thorax ventrally. Eyes and snout dull bluish. Length 38 mm. (Whitley.) New South Wales.

831

Gobius agulhensis Barnard.

Gobius agulhensis Barnard, Ann.
South African Mus., vol. 21, pt. 2, p.
821, Oct. 1927 (type locality, False
Bay; St. Sebastian Bay; Mossel
Bay; off East London; in 20 to 40
fathoms).

Depth 5 to $5\frac{1}{2}$, body feebly compressed;
head $3\frac{1}{5}$ to $3\frac{1}{2}$, width $1\frac{1}{3}$. Eye
4 in head, equal to snout; maxillary
reaches below front eye edge;
jaws subequal; teeth with outer
enlarged series, no canines; tongue
free, apically rounded; ~~interorbital~~
interorbital very narrow. Gill rakers
6 or 7 knobs on front arch. Pseudo-
branchiae moderately developed.
Small flap on front edge of
shoulder girdle usually present.
Scales 44 to 46 in lateral series;

11 or 12 transversely. Head, pre-dorsal and prepectoral regions naked. Vertical and horizontal series of papillae on cheeks and opercle, series round lower edge of preopercle continued (in a groove) on to lower surface of mandible.

D. VI - I, 11, fins narrowly separated; A. I, 10; caudal rounded, shorter than head; pectoral rays 21, upper rays not filamentous; ventrals reaching to or nearly to vent.

As preserved light brown, with darker irregular blotches on sides, sometimes forming more or less definite cross-bars. First dorsal faintly barred, with age black blotch between fourth and sixth spines. Second dorsal faintly spotted. Anal usually gray. Ventrals often dusky.

Length to 90 mm.

South Africa.

(Barnard.)

Gobius abei Jordan and
Snyder)

Gobius aliciae (Herre) 835a

Aboma aliciae Herre, Bull.
Raffles Mus. Singapore, no. 12, p.
10, pl. 7, May 1936 (type locality,
Reef in Singapore Harbor).
Herre and Myers, op. cit., no. 13,
p. 45, Aug. 1937 (type).

Depth 6; head $3\frac{1}{2}$. Snout 4 in
head; eye $3\frac{1}{4}$, greater than snout,
enters upper profile of head;
maxillary reaches front eye edge,
length $3\frac{1}{2}$ in head; mouth
~~slightly projects~~ oblique, lower
jaw slightly projecting; eyes with
inner margins touching.

Scales $27 + 1$ in lateral series,
8 transversely, 3 predorsal. Head
and most of predorsal region
naked, rest of body with ctenoid
scales.

D. VII - I, 8, third spine $1\frac{3}{4}$ in
head, first branched ray 2;

835b

A. I, 8, first branched ray 3; caudal $1\frac{1}{8}$, median rays longest and fin rounded behind; least depth of caudal peduncle 3; pectoral $1\frac{2}{5}$; ventral $1\frac{1}{5}$. Anal papilla $2\frac{1}{2}$ in eye, small, cylindrical, pointed.

Color in alcohol whitish, back and sides flecked with dusky dots and patches, and 5 large double black spots, last on caudal base. Black bar from eye to lower lip. Black stripes on cheeks and opercle. Black spot on pectoral base.

Length 42 mm. (Herre).
Singapore.

Gobius anjerensis Bleeker

(Ctenogobius caninus (not Valenciennes) Jordan
and Seale, Proc. U. S. Nat. Mus., vol. 28,
p. 796, 1905 (Negros). ~~Antipodes~~

Depth $4\frac{2}{5}$ to $4\frac{6}{13}$; head $3\frac{1}{4}$ to $3\frac{5}{8}$,
width $1\frac{3}{5}$ to $1\frac{3}{4}$. Snout $2\frac{7}{8}$ to
 $3\frac{3}{4}$ in head; eye $3\frac{1}{4}$ to 4, $1\frac{1}{5}$
in snout, greatly exceeds interorbital;
maxillary reaches opposite front
eye edge to $\frac{2}{5}$ in eye, length $2\frac{4}{5}$
to $3\frac{1}{5}$ in head; mouth subhori-
zontal, jaws even or lower shorter;
teeth fine, simple, conic, in bands
in jaws, outer row but little
enlarged, especially lower, which
with antero-lateral canine curved
back each side; tongue notched in
front; interorbital narrowly
concave, 8 or 9 in head. Gill rakers
 $1+4$, lanceolate, $\frac{2}{5}$ -gill filaments,
which $1\frac{2}{3}$ in eye.

Scales ~~26~~⁵⁰ to 31 in lateral
series to caudal base and 2 or 3
more on latter; 10 transversely;
8 or 9 predorsal forward to eyes.
Cheek and opercle scaly, muzzles
naked. Scales with 6 to 11 basal

Caudal brown, with dozen or more -dark transverse streaks. Pectoral with fine alternating waved white and brown transverse bands or lines.

28 in lateral series.

Gobius apogonius Cantor

854

Gobius apogonius Cantor, Journ.
Asiatic Soc. Bengal, vol. 18, pt. 2,
p. 1164, 1849 (1850) (type locality,
Pinang). — Günther, Cat. Fish.
Brit. Mus., vol. 3, p. 28, 1861 (types).
— Fowler, ~~Cat.~~ ^{List} Fish. Malaya, p.
216, 1937 (reference).

— Károli, Termesz. Füzetek, Budapest,
vol. 1, p. 164, ¹⁸⁸¹ (1882) (Bangkok). —
Swatti, Index Fish. Siam, p. 152,
1936 (reference).

Depth $3\frac{1}{2}$ in total length; head 4, depressed. Muzzled broad, rounded; eye 4 in head, equals interorbital; mouth cleft oblique, reaches $\frac{1}{2}$ in orbit, lower jaw slightly projecting beyond upper; teeth 7 in both jaws velvety, outer upper series of a few distant teeth slightly larger than rest, and below similar internal series of which 2 nearest symphysis have appearance of small canines; tongue thin, narrow, crescent shaped, smooth.

Scales 25 in lateral series; 10 transverse. Scales generally very large, particularly on crown of head and opercles finely ciliated and striated.

D. VI - I, 7, fourth spine ends in filament and slightly exceeds greatest body depth; A. I, 8; sixth divided ray, also of second dorsal 6 in total body length; caudal 4;

8546

rounded; pectoral rays 18, fin rounded, nearly long as caudal, upper rays silk like or filamentous; ventral rays I, 5, fin little pointed, scarcely $\frac{1}{2}$ of pectoral.

Back brownish, sides and abdomen buff, opercles minutely dotted with black. Back and sides with 5 or 6 parallel, sometimes interrupted series of black spots. Iris pale golden, spotted with black. On first dorsal 2 elongated black spots, of which posterior between fourth and fifth rays. Second dorsal and anal with 2 or 3 transverse series of black spots, and with their free margins black. Caudal edged with black with a number of somewhat irregular transverse series of black spots. Ventrals with ends of 2 central rays (the fifth) black.

4 *Acantholepis marginatifer* new species -

4 Depth $4\frac{1}{2}$ to $4\frac{3}{5}$; head $3\frac{1}{3}$ to $3\frac{2}{5}$, width $1\frac{4}{5}$ to 2. Snout 4 to $4\frac{1}{2}$ in head; eye $3\frac{3}{4}$ to 4, greater than snout and greatly exceeds narrow interorbital; maxillary reaches $\frac{1}{2}$ in eye, length 3 in head; teeth simple, conic, close set, in narrow bands in jaws; interorbital very narrow low ridge, width $\frac{1}{4}$ of eye; long, conspicuous preopercular spine subequal with to slightly longer than eye. Gill opening lateral slit, about $2\frac{1}{2}$ in head.

Scales 20 or 21 + 2 in axial lateral series from behind suprascapula; 9 transversely above anal origin. Head, chest, breast, prepectoral and predorsal regions naked. Scales with 9 to 15 basal radiating striae; 25 to 36 apical denticles, uniserial, graduated larger laterally; circuli very fine.

Length 60 mm. (Cantor, Günther.^{854c})

In Malaya). Cantor says it is closely allied to Gobius sadanundio Buchanan-Hamilton, in its fin rays, large scales and black markings on fins and body.

G. sadanundio is said to be of strikingly more elongated shape, third spine of first dorsal longest and fourth shorter, not ending in a filament.

and at caudal base medially.
Each scale on side of body with slightly darker basal spot. Dark brown shade on cheeks below eye. Side of head, prepectoral region and whole side of body more or less, with small round pearl blue spots, those on head and anterior part of body little ocellated with narrow brown line. Fins all gray white, with dark blotches on back reflected on bases of dorsals. Iris gray white.

Philippines. A handsome ornate little fish, remarkable not only for its long preopercular spine but its filamentous fins as well.

U. S. N. M., No. 99047. Masapit, tide pool, Mindanao. August 1, 1907. Length 42 mm. Type.

Also the following ~~paratypes~~:
Eighty examples, same data. Length 21 to 40 mm.

Gobius aterrimus (Herre)

855

Ctenogobius aterrimus Herre,

One example. Pangauron River,
Port Calton, Busuanga Island.
December 16, 1908. Length 36 mm.

Dynamite. January 29, 1909. Length
48 mm.

Gobius atrichypus Garman

857

Gobius atrichypus Garman, Bull.
Mus. Comp. Zool., vol. 39, p. 233, pl. 2,
fig. 1, 1903 (type locality, Bay of
Moala, East Fiji, in 25 fathoms).

Gobionellus atrichypus Jordan and Seale,
Bull. Bur. Fisher., vol. 25, p. 407, 1905
(1906) (reference).

Ctenogobius atrichypus Fowler, Mem.
Bishop Mus., vol. 25, p. 412, 1928
(copied).

Depth $5\frac{1}{3}$; head $3\frac{1}{8}$. Snout $4\frac{3}{7}$ in head, pointed in profile, subtruncate as seen from above; eye 3 in head, greater than snout, close to one another and close to but not entering upper profile of head; maxillary oblique, reached $\frac{1}{3}$ in eye, length $2\frac{3}{5}$ in head; teeth small, in bands, with 1 or 2 canines at each side above and below; interorbital space very narrow.

Scales 25 in lateral series; 10 transversely. Occiput covered with scales to bridges behind orbits. Scales large, ctenoid, with minute teeth. Opercle scaly.

D. VII-12, second spine $2\frac{1}{4}$ in head, second ray $2\frac{1}{5}$, tenth ray $1\frac{2}{3}$; A. 12, third ray $2\frac{2}{3}$, tenth ray $2\frac{1}{2}$; caudal long, pointed behind, tending in filament, length $2\frac{1}{2}$ in rest of fish; least depth of caudal peduncle $2\frac{7}{8}$ in head; pectoral $1 + \frac{1}{10}$ times head, rays 15, ending in filament

8576
above fourth or fifth anal ray;
ventral $1\frac{1}{5}$ in head.

Color light brown, fins darker.
A series of small brown spots along
middle of flanks from cheek to
a black spot on bases of median
caudal rays.

Length not given; figure 135 mm.
lang. (Garman.)

Fiji Islands. Only known from
Garman's account.

Gobius atripinnatus H. M. Smith

Rhinogobius atripinnatus H. M. Smith,
Proc. U. S. Nat. Mus., vol. 79, art. 7,
p. 45, 1931 (type locality, Gulf of
Siam, off Tachin River, Central Siam;
Maenam Chao Phaya; Chantabun River at Lem Xung).
— Swatti, Index Fish. Siam, p. 154, 1936
(Maenam Can Phaya; Canthaburi R.).

Depth 4, rather plump, moderately
compressed; head $3\frac{1}{3}$. Eye little
less than 5 in head, equals snout,
greater than interorbital; hind
angle of jaws under front part
of eye; mouth oblique, rather
small, lower jaw slightly pro-
jecting; teeth in 3 or 4 rows in
each jaw, outer row enlarged and
wide spaced; large, stout, back-
ward curved lateral canines on
each side of lower jaw; tongue
truncate at tip.

Scales 27 in lateral series; 9⁸⁵⁹ transversely; 25 predorsal scales. extend into interorbital space, Cheek and ~~lower~~^{upper} half of opercle with large scales. Prominent lines of mucous pores on head; double row horizontally across middle of cheeks, 3 rows on lower part of cheeks, suborbital row continuous with postorbital row along upper edge of opercle to upper angle of gill opening. D. VI-I, 10, first dorsal rather low, second dorsal like anal, neither when depressed reaching caudal; A. I, 10; paired fins equal head less snout; ventral rather short, reaches $\frac{2}{3}$ to anal.

Body and head light brown, without markings. Muzzle blackish. All fins black except dusky pectorals.

U. S. N. M., no. 90321. Gulf of
Siam off Tachin River, central
Siam. December 14, 1927. Length
60 mm. Type of Rhinogobius
atripinnatus.

861

Gobius atripinnis Fowler

Gobius atripinnis Fowler, Proc.
Acad. Nat. Sci. Philadelphia, vol.
86, p. 81, figs. 21 or 22, 1934 (type
locality, Sander, East Bali).

Depth $4\frac{3}{5}$ to $4\frac{2}{3}$; head 3 to $3\frac{1}{4}$, width $1\frac{1}{2}$ to $1\frac{3}{5}$. Snout 4 to $4\frac{1}{2}$ in head from snout tip; eye $4\frac{1}{2}$ to $5\frac{4}{5}$, 1 to $1\frac{1}{2}$ in snout, 1 to $1\frac{1}{4}$ in interorbital; maxillary reaches $\frac{1}{5}$ to $\frac{3}{5}$ in eye, very oblique, length 2 to $2\frac{3}{4}$ in head from snout tip; lips rather broad, fleshy; teeth moderate, simple, conic, above outer row little larger and transversely 2 or 3, below similar with 2 or 3. Transversely and nearly uniform; tongue obtuse, fleshy, thick; interorbital $4\frac{3}{5}$, low, level. Gill rakers 3 + 2, lanceolate, robust, $\frac{1}{3}$ of gill filaments, which $1\frac{1}{5}$ in eye. Scales 30 in lateral series to caudal base and 3 more on latter; 13 transversely at anal, 10 or 11 predorsal forward opposite hind preopercle ridge. Head and occiput entirely naked. Scales with 25 to 32 basal radiating striae;

8616

42 short, slender apical denticles; circuli very fine.

D. VII—I, 10, I, third spine 2 to $2\frac{1}{5}$ in total head length, first branched ray $2\frac{1}{5}$ to $2\frac{1}{3}$; A. I, 8, I, fifth branched ray 2 to $2\frac{1}{5}$; least depth of caudal peduncle $2\frac{1}{5}$ to $2\frac{7}{8}$; caudal $1\frac{1}{5}$ to $1\frac{1}{4}$, rounded; pectoral $1\frac{1}{5}$ to $1\frac{2}{3}$, rays 17 of which 2 uppermost slender, detached and silk like; ventral $1\frac{3}{5}$ to $1\frac{3}{4}$ in total head length. Anal papilla $\frac{1}{2}$ of eye.

Brown, more or less uniform and deeper tints about jaws and interorbital. Slightly darker bars radiate from eye in orbital socket. Opercle and edge of gill opening broadly gray brown. Vertical fins and ventrals blackish though caudal more or less dark gray with 5 transverse black bands. Pectoral like caudal but with base largely blackish with transverse black bars

5 or 6.

86/c

South East Bali. Approaches Gobius caurensis Bleeker in the possession of several of the lower posterior teeth suggestive of canines, in that they are slightly enlarged or at least a little outstanding or conspicuous. G. caurensis differs, however, in larger scales (25 to 27) and more branched anal rays (11 or 12), besides coloration.

Gobius bibarbatus Von Bonde

Gobius bibarbatus Von Bonde, Fishes.
Marine Surv. South Africa, ^{Rep. no. 1,} Spec.
Rep. no. 1, p. 28, pl. 6, 1922 (Type
locality, Station 312 Pickle, in 50 fathoms,
off South Africa).

— Barnard, Ann. South African
Mus., vol. 21, pt. 2, p. 825, Oct. 1927
(St. Helena, Saldanha and St.
Sebastian Bays, in 28 to 50
fathoms).

Depth 4 ~~4~~ to 5 (young); head 3 to $3\frac{1}{5}$. Snout $4\frac{1}{3}$ in head from snout tip; eye 4 (young) to 5, subequal with snout, greatly exceeds interorbital; maxillary reaches $\frac{1}{2}$ in eye, length $2\frac{9}{10}$ in head from snout tip; mouth low, but little inclined, lower jaw projecting; lips thick; teeth simple, in bands in both jaws, outer band largest, no canines, ^{tongue free, rounded, truncate} interorbital 2 in eye (young), slightly larger in adult, with eye entering upper profile of head. Lower gill rakers 8.

Scales 56 to 58 in lateral series; 15 or 16 transversely. Head naked, except small scales on nape. Vertical and horizontal series of papillae on cheeks and opercle, a series around preopercle edge continued to lower surface of mandible. Two pores in median line in

8692

interorbital space. Scales ctenoid, (more or less uniform on figure). Two short barbels on chin. Flap on shoulder girdle.

D. VI, I, 13, third spine $1\frac{2}{5}$ in total head length, first branched ray $1\frac{4}{5}$; A. I, 12 or 13, first branched ray $2\frac{2}{3}$; caudal $1\frac{1}{3}$, rounded behind; least depth of caudal peduncle 3; pectoral $1\frac{1}{4}$, rays 21; ventral rays I, 5, fin $1\frac{2}{7}$ in total head length.

Color yellowish or brownish, scales dotted with greenish, also on pectoral base and on fins terminally, opercle and preopercle. Opercle purplish. Vertical fins purplish, with darker cross bars. Paired fins dusky, or pectoral light purplish clouded with darker streaks. Preserved specimens with irregular dark blotches on sides. (Von Bonde, Barnard.)

South Africa. Reaches 130 mm.

(Adelaide, South Australia).

Plotosus anguillaris (Bloch).

Platystacus anguillaris Bloch, Nat. Ausland. Fische, pt. 8, 1794, p. 61, pl. 373, fig. 1 (type locality, not given; collection Herr John).

Plotosus anguillaris Günther, Journ. Mus. Godeffroy, vol. 8, pt. 16, 1909, p. 372 (Society Is.).--Fowler, Mem. Bishop Mus., vol. 10, 1928, p. 63 (compiled).

Depth $5\frac{1}{4}$; head 4. Snout 3 in head from snout tip; eye 4 to $4\frac{1}{2}$, $1\frac{1}{4}$ in snout, closely set; maxillary reaches $\frac{1}{5}$ in eye, length 2 in head from snout tip; mouth oblique, begins in front well below level of lower eye edge, lower jaw slightly protruding; both jaws with band of fine curved teeth, outer row little enlarged, lower little less wide set though more clearly canine-like; eye enters upper profile of head.

Scales 42 to 45 in lateral series; head and prepectoral region naked. Scales larger on body posteriorly, small on caudal base. D. VII - 11, third spine $1\frac{3}{5}$ ^{in total head length}; first branched dorsal ray $1\frac{3}{4}$; A. 10 or 11, last ray $1\frac{1}{3}$; caudal $2\frac{1}{2}$ in rest of fish, ends in long median point behind, least

depth of caudal peduncle $2\frac{1}{6}$;
 pectoral $2\frac{9}{10}$ in fish without
 caudal; ventral equals caudal.

Ground color light brown,
 in female belly pale yellow anter-
 iorly, silver white to vent, and
 on under half of body below second
 dorsal with variable black streaks
 and lines. Behind pectoral base
 broad black longitudinal band
 below first or to second dorsal,
 then above row of blackish spots.
 From lower eye edge dark brown
 band to mouth angle; a second
 back to lower pectoral base; third
 postocular to shoulder ending in
 large black blotch. Both dorsals with
 blackish longitudinal band, little
 below middle. Anal border dark.
 Caudal with 3 or 4 dark transverse arched
 cross bands. Paired fins nearly black
 in male, white in female. (Kner.)

New South Wales. Length 90 to
 118 mm.

U. S. N. M., no. 59925. Port
 Jackson, New South Wales. 1904.

Soc. London, 1935, p. 113, text fig. 8 A (compiled).

874

each jaw, outer ones scarcely enlarged; eye entering upper profile of head.

Scales 26 in lateral series; 8 transversely, 7 predorsal forward to 8. Opercles covered by 4 large scales.

D. VI — I, 7, first spine $1\frac{1}{6}$ in total head length, first branched ray $1\frac{4}{5}$, penultimate $1\frac{2}{3}$; A. I, 6, first branched ray $2\frac{1}{8}$, penultimate ray $1\frac{5}{6}$; caudal $1\frac{1}{5}$, pointed behind; least depth of caudal peduncle $2\frac{1}{10}$; pectoral $1\frac{1}{2}$; ventral $1\frac{1}{2}$. Anal papilla $2\frac{1}{2}$ in eye.

In alcohol varies from whitish to blackish gray, with 4 more or less evident short broad dorsal crossbands and median lateral row of 4 prominent black spots. Black spot at

875

tip of opercle and pectoral
axil. Two spots at caudal
base. Four short black cross
bars on underside, 2 beneath
anal, and 2 on caudal peduncle.
Scales on sides of body more
or less outlined with bands
of dusky spots, their pale centers
forming longitudinal rows be-
tween blackish lengthwise lines.
Sides of head irregularly barred
and spotted. Females much
paler than males. First dorsal
black, or all golden whitish with
a large black spot between fifth
and sixth spines. Second dorsal
alternately crossbarred with black
and golden or clear. Anal black.
Caudal crossbanded alternately
with black and golden or clear.
Pectorals clear or faintly dusky. Ventrals
black or with broad pale margin.

Length 23 to 26 mm. (H. ever.)
Philippines.

One example. Iwahig River and
tributaries, Puerta Princesa,
Palawan. April 4, 1909. Length
44 mm.

(Hawaii); Bishop Mus. Bull., no. 22, 1925, p. 23 (Honolulu); no. 38, 1927, p.

Gobius bivittatus (Herre)

Tamanka bivittata Herre, Gobies of Philippines, p. 224, pl. 17, fig. 4, 1927 (type locality, Hoihow, Hainan).

Depth $4\frac{4}{5}$; head $3\frac{2}{5}$, width $1\frac{1}{5}$. Snout 3 in head; eye 5, $1\frac{3}{5}$ in snout; maxillary reaches $\frac{2}{5}$ in eye, length $2\frac{1}{4}$ in head; mouth low, little oblique, lower jaw slightly inclined, cheeks bulging; eyes entering upper profile of head.

Scales 44 in lateral series; 13 transversely, 22 predorsal forward nearly to eyes. Small scales on opercle and prepectoral.

D. VII I, 7, third spine $1\frac{3}{4}$ in head, first branched ray $2\frac{1}{5}$, last ray 2; A. I, 7, first branched ray $2\frac{3}{4}$, last ray $2\frac{1}{5}$; caudal $1\frac{1}{3}$,

convex behind; least depth of caudal⁸⁷⁸
peduncle 2; pectoral $1\frac{1}{3}$; ventral
 $1\frac{2}{3}$.

Color in alcohol uniform brown, darker above on head, posterior half yellowish brown beneath. From above preopercle dark brown slightly convex band back to base of caudal, continuing back on fin as blackish line. Similar band from under pectoral to caudal base and on fin as blackish line. Bands much more distinct on posterior half of body. Blackish vertical ~~band~~ mark on pectoral. Several vague dark crossbands on anterior half of trunk. Black bar on upper margin of caudal, below dark brown lengthwise stripe. First dorsal light brown with large black spot on upper part of

879
membrane between fifth and sixth
spines. Second dorsal brown with
darker markings. Other fins
uniform in color with body.

Length 29 mm.

(Herre.)

Hainan, China.

1927 (Amoy).

Depth $5\frac{1}{5}$ to $5\frac{2}{5}$; head 4 to $4\frac{1}{10}$,
width $1\frac{1}{4}$ to $1\frac{2}{5}$. Snout $3\frac{1}{4}$ to
 $3\frac{4}{5}$ in head; eye $3\frac{1}{4}$ to $3\frac{4}{5}$, $1\frac{1}{3}$
in snout, greatly exceeds interorbital;
maxillary reaches front eye edge,
length $2\frac{2}{5}$ in head; mouth
terminal, low, slightly oblique;
2 rows of teeth in each jaw,

outer enlarged, with lateral ⁸⁸³
pair of canines in lower jaw;
interorbital $\frac{1}{4}$ to $\frac{1}{3}$ of eye, which
enters upper profile of head.

Scales 46 to 48 in lateral
series; 16 transversely. Head
and nape entirely naked and
central naked area extends
back to dorsal base. Tiny scales
on pectoral base and breast.
Body covered with ctenoid scales,
largest posteriorly, and along
dorsal base much smaller and
becoming minute and disappearing
above opercles. Two parallel
longitudinal rows of minute
papillae across middle of
preopercle, and vertical and
transverse row on opercle.

D. VI - I, 10, second spine $1\frac{1}{5}$
in head, first branched ray $1\frac{7}{8}$,
penultimate ray $1\frac{1}{8}$; A. I, 9, first

884

branched ray 3, penultimate ray
 $1\frac{1}{2}$; caudal somewhat pointed,
 $3\frac{4}{5}$ in rest of fish; least depth
of caudal peduncle $1\frac{3}{4}$ in head;
pectoral $1\frac{1}{8}$; ventral $1\frac{1}{3}$.
Anal papilla very small and
slender in male, subglobose in
female.

In alcohol uniform brownish,
with faint though darker lateral
band from pectoral axil to
caudal base. Large, vague dusky
spot on opercle. Fins uniform
in coloration, paler than body.
Second dorsal with traces of
dark spots. Anal and caudal
with blackish margins.

Length 54 to 62 mm. (Herre.)
China.

885

Gobius brocki (Herre)

Vaimosa brocki Herre, Bull. Raffles Mus. Singapore, no. 12, p. 9, pl. 5, May 1936 (type locality, Reef in Singapore Harbor). — Herre and Myers, op. cit., no. 13, p. 40, Aug. 1937 (type).

Depth $3\frac{4}{5}$; head $3\frac{1}{10}$. Snout $3\frac{3}{4}$ in head from snout tip; eye $3\frac{3}{7}$, subequal with snout, enters upper profile of head; maxillary extends just behind hind margin of eye (not quite opposite hind eye edge in figure), length $1\frac{2}{3}$ in head from snout tip, mouth oblique, lower jaw protruding; interorbital equals eye.

Scales 22 or 23 in lateral series to caudal base and 2 or 3 more on latter; 7 transversely, 8 predorsal. Scales large, thin, very deciduous.

D. VII — I, 7, third spine $1\frac{3}{4}$ in total head length. first

885a
branched ray 2; A. I, 8, first
branched ray $2\frac{9}{10}$, seventh $2\frac{2}{5}$;
caudal $1\frac{1}{8}$, ends in median point
behind; least depth of caudal
peduncle $2\frac{9}{10}$ in head; pectoral
 $1\frac{2}{4}$, pointed, without detached
free rays; ventral $1\frac{3}{4}$, anal
papilla 2 in eye, rather pointed.

Color in alcohol very pale
brown, with dusky spot on caudal
base and brown bar over base
of first 3 dorsal spines and
down side to beneath pectoral.
Minute brown specks dusted
over top and sides of head and
trunk, dorsals, anal and caudal.
Other fin colorless.

Length 28 mm. (Herre.)

Singapore. Said to have the
back moderately convex and the
belly greatly distended with
eggs. Dorsals, anals and ventrals
small, and soft dorsal and anal
falling far from caudal base.

Gobius buccatus Valenciennes

Gobius buccatus Valenciennes, Hist.
Nat. Poiss., vol. 12, p. 14 (45), 1837
(type locality, none given; "ap-
portée par Péron"). — Günther,
Cat. Fish. Brit. Mus., vol. 3, p. 14,
1861 (copied). — Martens, Preuss.
Exped. Ost Asien, vol. 1, p. 391, 1876
(Batjan).

Head 4 in total length, broader than long, over $\frac{1}{3}$ wider than deep. Eye 6 in head, 2 in interorbital. Mouth vertical. Cheeks large, set forth head.

Scales moderate.

D. VI I, 11; A. I, 10.

Apparently all brown colored, somewhat more fawn colored below. Fins brown. Border of first dorsal pale.

Length 152 mm. (Valenciennes.)

A doubtful species. Valenciennes calls it "Le Gobie a grosses fèves" and says "On ignore le lieu précis où il a été pris" though "Cette espèce a été apportée par Péron."

887

889

Depth $4\frac{1}{2}$ to $5\frac{4}{5}$ ($3\frac{1}{10}$ in spawning female); head 3 to $\frac{1}{5}$. Snout $3\frac{1}{5}$ to $4\frac{2}{3}$ in head; eye $3\frac{1}{2}$ to 4, subequal with snout, greatly exceeds interorbital; maxillary reaches $\frac{2}{3}$ in eye, length 2 in head from snout tip; mouth cleft oblique, begins in front slightly below level of lower eye edge; 4 rows of teeth in each jaw, in outer row largest and fixed, others all depressible; teeth of fourth row next in size but very much smaller, and those of 2 inner rows minute; upper outer row of teeth much larger and more widely spaced than any of others; tongue rounded; interorbital space very narrow, width 5 in eye.

Scales 28 to 30 in lateral series; 10 transversely; 9 or 10 predorsal. Cheeks with 3 rows of large cycloid

890

scales, with prominent longitudinal groove below upper row; opercles naked below; with 1 or 2 rows of cycloid scales along upper margin; few cycloid scales on front angle of breast. Body covered with large ctenoid scales, extending forward on nape between hind part of eyes.

D. VI — I, 10, first spine $1\frac{9}{10}$ in total head length, seventh branched ray $1\frac{2}{5}$; A. I, 9, seventh branched ray $1\frac{1}{2}$; caudal $1\frac{1}{3}$, convex behind; least depth of caudal peduncle $2\frac{3}{5}$; pectoral $1\frac{1}{3}$; ventral $1\frac{1}{2}$. Anal papilla long, slender, pointed, length $1\frac{1}{3}$ in eye; in females short, broad, cylindrical, round tipped, less than pupil.

In alcohol pale brown above, merging into white below. Whittish spot in center of each

891
brown scales, spots forming longitudinal lines. Large, nearly circular, blackish spot on caudal peduncle base and 4 similar much paler spots along median lateral line, anterior one beneath pectoral and in line with first dorsal. In some specimens these spots connected by blackish line. Large dusky iridescent silvery spot on opercle before pectoral. Upper part of eye covered by heavily pigmented blackish band, pupil white, cornea with more or less blue iridescence. Dorsals and anals sprinkled with minute specks of dark brown. Caudal dusky, with several white crossbars or rows of spots. Pectoral base with dusky spot on upper part. Paired fins faintly marked with dusky specks or central part

of ventrals blackish.

Length 43 to 77 mm.

(Herve.)

Philippines, Siam.

893

Gobius caninoides Bleeker

Gobius caninoides Bleeker, Nat.

Tijds. Ned. Indie, vol. 3, p. (235) 274,
1852 (type locality, Amboina);

vol. 11, p. 385, 1856 (Kajeli, Buru);

Tijds. Ned. Indie, vol. 22, p. 108,

Günther, Cat. Fishes Brit. Mus., vol. 1, p. 36, 1861 (copied).
1860 (Muntok, Banka); Verslag.

Kon. Akad. Wet. Amsterdam, ser.

2, vol. 7, p. 36, 1873 (Am Ind.).

Depth $5\frac{1}{2}$ to 6 in total length; head $4\frac{1}{2}$, width $1\frac{2}{3}$ to 2. Snout obtuse convex, shorter than eye; 3 to $3\frac{1}{3}$ in head, advanced in head, very close to opposite eye; mouth oblique, reaches below front edge of eye, jaws equal; teeth small, in several series, outer row larger; 2 small curved canines in lower jaw; post-ocular groove distinct.

Scales 30 in lateral series.

D. VI - I, 10 or I, 11, first dorsal rounded and median spines longest, second dorsal angular; A. I, 10 or I, 11; caudal rounded, length $5\frac{1}{2}$ to 6 in body; vertical fins subequally high, lower than body, rays not produced; pectoral rays I, 17, rounded; ventral I, 5, rounded. Anal papilla conic, obtuse.

Color of body green. Many scales of back and sides each with blackish dot, forming more or

less longitudinal rows on sides.

Dorsals and caudal with black spots, on first ^{dorsal} fin in 2 longitudinal series, on second dorsal fin in 3 longitudinal series; on caudal in 4 or 5 transverse series and fin margined with violet posteriorly. Fins largely yellowish otherwise. Anal violet.

Length 55 to 80 mm. (Bleeker.)

901

Depth $4\frac{1}{4}$ to $4\frac{3}{4}$; head $3\frac{1}{2}$ to $3\frac{3}{5}$.
width $1\frac{1}{5}$ to $1\frac{2}{5}$. Snout 3 to $3\frac{1}{8}$
in head from snout tip; eye $4\frac{2}{5}$
to $4\frac{3}{4}$, $1\frac{1}{2}$ in snout, greater than
interorbital; maxillary reaches
opposite front eye edge, length $2\frac{1}{2}$
in head from snout tip; mouth
cleft low, little inclined, mandible
slightly protruded; teeth very fine,
in bands in jaws, outer row
little enlarged and wide spaced,
and 2 close set canines each side
medially in lower jaw; interorb-
ital space 2 in eye, which nearly
enters upper profile of head.

Scales 28 to 30 in lateral
series; 10 transversely, 16 to 24
predorsal forward to eyes. Few
small scales on opercle above,
also on prepectoral region in
some specimens. Several rows of ^{papilla}
longitudinally on cheeks, also post-

902

ocular line; vertical row on front of opercle with several short cross bars. Predorsal scales very small, and small scales on trunk, become large on tail and especially on caudal peduncle.

D. VI, I, 9, I, third spine $1\frac{3}{4}$ to $1\frac{4}{5}$ in total head length, first branched dorsal ray $1\frac{7}{8}$ to 2, penultimate ray $1\frac{3}{4}$ to $1\frac{4}{5}$; A. I, 9, first branched ray $2\frac{7}{8}$ to 2, penultimate ray $1\frac{3}{4}$ to $1\frac{4}{5}$; caudal 1, convex behind; least depth of caudal peduncle 2; pectoral $1\frac{1}{4}$ to $1\frac{2}{5}$; ventral $1\frac{2}{5}$ to $1\frac{1}{2}$.

Color olive or brown above, paler to whitish on under surfaces. Five dark or blackish cross bars on back, first above pre-opercle, second above pectoral base, third at last dorsal spines,

903

fourth below middle of second dorsal and fifth on caudal peduncle and at bases of last dorsal rays. Along middle of side 5 large blackish spots. Above pectoral origin large dark green spot, usually large as eye and bordered with black. Fins brownish, first dorsal with inclined gray black bands. Caudal often dark gray, also paired fins.

Madagascar, Zanzibar, East Indies, Malay, Philippines, China, Siam, Amur River, Korea?, Polynesia.

Gobius ophthalmotenia (not Bleeker)
Playfair, Fishes of Zanzibar, p. 71,
1866 (part; on Peters).

Depth 4 to $4\frac{1}{2}$; head $3\frac{1}{3}$ to $3\frac{1}{2}$.
 Snout $3\frac{3}{4}$ in head from snout
 tip; eye $3\frac{1}{2}$ to 4, subequal with
 snout, very close together; max-
 illary reaches opposite front
 eye edge, length $2\frac{3}{5}$ in head
 from snout tip; ~~mouth~~ oblique,
 begins in front below level of lower
 eye edge; outer row of teeth enlarged,
 and 2 canines on each ^{side of} mandible; eye
 enters upper profile of head.

Scales 31 in lateral series; 9
 transversely.

D. VI I, 12, second spine $1\frac{7}{8}$ in
 total head length, first ray of
 second dorsal 2, last ray $1\frac{1}{4}$;
 A. I, 12, first ray $2\frac{3}{4}$, last ray $1\frac{1}{5}$;
 caudal 1, rounded behind; last
 depth of caudal peduncle 3;
 pectoral 1; ventral $1\frac{1}{8}$.

Greenish, with 5 transverse bands
 on back. 5 regular white spots on
 scales. Black line from eye on postocular.

907b

Cheek brown, with white spots.
Pectoral base brown, with small
gray spots between bases of rays.
Front part of dorsal, also caudal
fin, with black spots.

Length 62 mm. (Sawage, Barnard.)

^{no.} Fische, p. 462, fig. 89 (types).

Depth 5; head $3\frac{3}{7}$, width $1\frac{1}{2}$.
 Snout 4 in head; eye $3\frac{3}{5}$, greater than snout, equals interorbital; maxillary reaches $\frac{1}{2}$ in eye, length $2\frac{1}{2}$ in head; jaws subequal with snout tip level with lower eye edge; teeth fine, pluriserial, without canines; eye enters upper profile of head.

Scales 45 in lateral series, largest on caudal peduncle and caudal base; 12 transversely, 21 predorsal forward above opercle. Scales ctenoid, anteriorly cycloid. Opercle scaly, head otherwise largely naked. Row of papillae around lower border of eye, above maxillary and parallel behind posterior edge of preopercle.

D. VII - 9, third spine $2\frac{3}{5}$ in head, second ray $2\frac{1}{4}$; A. 9, fifth ray $2\frac{1}{5}$; Caudal $3\frac{2}{5}$ in rest of fish, rounded behind;

9096

least depth of caudal peduncle $2\frac{1}{8}$;
pectoral $1\frac{1}{3}$, rays 16; ventral
rays $\overline{I}, 5$, fin $1\frac{2}{3}$ in head.

Brown, with darker cross
bands on back and tail obscure.
Head uniform. (Figure shows
oblique black bar from lower
hind eye diagonally across
cheek, also dark line along
upper edge of upper lip.) First
dorsal dotted with blackish,
and blackish longitudinal band
on upper half. Second dorsal
dotted gray, with hyaline edge
around median black blotch
on each membrane, all forming
broad, dark, median band on fin.
Caudal with + yellowish cross
bands, alternating more or less
with blackish. Anal and paired
fins dotted gray, first with clear
edge.

Length 40 mm.

East Indies.

(Weber.)

Gobius cheni Nichols

909c

Gobius cheni Nichols, Amer. Mus.
Novit., no. 497, p. 1, Oct. 6, 1931 (Type
locality, Hsow, northeastern
Kiangsi).

Depth $6\frac{4}{5}$ to $7\frac{1}{2}$; head $3\frac{3}{5}$ to $3\frac{4}{5}$, width $1\frac{7}{10}$,
of head depressed and lower
surfaces flattened. Snout $3\frac{1}{5}$
in head; eye $4\frac{3}{5}$ to 5 , superolateral,
close together; maxillary reaches
under front of pupil, length $2\frac{3}{5}$
in head; mouth almost horizontal,
lower jaw projecting; no canine
teeth; interorbital $2\frac{7}{10}$ in eye.
Gill opening extends forward below
hind preopercle edge.

Scales 34 to 35 in lateral series.

Scales suppressed or absent on breast,
head, nape and midline of pre-
dorsal.

D. $VI-9$, origin of first dorsal
epidistant from snout end and
middle of anal base, longest spine
 $2\frac{2}{5}$ in head, longest ray $2\frac{1}{5}$; A.

909a

8 or $8\frac{1}{2}$ [9], longest ray $2\frac{1}{3}$; caudal
 $1\frac{2}{5}$, rounded, subacuminate;
pectoral $1\frac{2}{5}$, reaches $\frac{2}{3}$ to anal,
least depth of caudal peduncle 3;

much beyond ventrals; ventral $2\frac{1}{5}$,
united, form almost circular disk.

Head, back and sides with
blackish spots. Row of 9 irregular
(black) blotches mostly slightly
below middle of side. Dorsals
spotted and caudal with 5 or 6
irregular cross bars. Pectoral
with dark spot on base and
closely followed by a short, and
then a longer more diffuse bar.

Length 47 to 55 mm. $\frac{1}{4}$ without
caudal. (Nichols.)

China. Gobius hadropterus differs
in depth $4\frac{1}{3}$ to 5, predorsal completely
scaled and lateral scales 30 to 32.

910

Gobius chiengmaiensis (Fowler)

Rhinogobius chiengmaiensis Fowler, Proc.
Acad. Nat. Sci. Philadelphia, vol.
86, p. 157, fig. 126, 1934 (type locality,
Chiengmai, North Siam). — Suwatle,
Index Fish. Siam, p. 154, 1936
(reference).

Depth $4\frac{7}{8}$ to $5\frac{1}{5}$; head $2\frac{7}{8}$ to $3\frac{1}{5}$, width $1\frac{1}{3}$ to $1\frac{1}{2}$. Snout $3\frac{1}{4}$ to $3\frac{3}{5}$ in head from snout tip; eye $3\frac{4}{5}$ to 4, subequal with snout, much greater than interorbital; maxillary rather short, reaches opposite front eye edge, length 3 to $3\frac{1}{2}$ in head from snout tip; teeth simple, conic, little curved, minute, uniserial in jaws, none on palate or tongue; tongue not distinct or little free from floor of mouth; interorbital $\frac{2}{5}$ of eye, low, depressed or level. Gill rakers 1 + 4, short points about $\frac{1}{2}$ of gill filaments, which nearly $\frac{1}{3}$ of eye.

Scales 26 or 27 in axial lateral series from over gill opening to caudal base and 2 or 3 more on latter; 8 transverse between dorsal and anal origins; preanal naked medially, also pectoral base, chest and breast. On fins

only few scales on caudal base.
 Scales with 15 or 16 slightly
 radiating basal striae; 34 or 35
 apical denticles, smaller medi-
 ally; circuli fine, basal.

D. VI-1, 8, spines somewhat
 flexible, third spine $1\frac{7}{8}$ to $2\frac{1}{5}$ in
 total head length, seventh ray
 $1\frac{2}{3}$ to 2; A. I, 7, sixth ray $1\frac{3}{4}$ to
 2; caudal $1\frac{1}{8}$ to $1\frac{1}{5}$, convex be-
 hind; least depth of caudal
 peduncle $2\frac{3}{4}$ to 3; pectoral 3
 to $3\frac{1}{4}$ in combined head and
 body to caudal base; ventral
 $1\frac{1}{4}$ to $1\frac{2}{5}$ in total head.

Pale brownish. Along side of
 body 5 large ill-defined dark
 blotches. Head with obscure
 dark reticulations, also extended
 on predorsal. Obscure dark spots
 on cheeks, fewer on snout above.
 Iris slate gray. Fins largely
 uniformly pale. Spinous dorsal
 with black spot, nearly large

910c

as eye, another on fin, also numerous other smaller and lighter dark spots. Soft dorsal with 4 rows of dark spots, caudal with 5, which form more or less transverse bands. Anal pale basally, with submarginal blackish slate band, edge of fin narrowly whitish. Pectoral fins uniformly pale, dusted obscurely with minute brownish dots.

Northern Siam.

A. N. S. P., No. 59774. Chiang Mai, North Siam. December 30, 1932. R. M. de Schauensee. Length 29 mm. Type.

A. N. S. P., Nos. 59772 and 59773. Chiang Mai. December 1932. R. M. de Schauensee. Length 33 to 35 mm. Paratypes.

— Chu, Biol. Bull. St. John's Univ.,
no. 7, p. 160, Jan. 1931 (reference).

Depth $5\frac{1}{4}$; head $4\frac{3}{4}$, broad as high or $\frac{1}{4}$ longer than broad. Snout obtuse, rounded, longer than eye; eye 6, equals interorbital; mouth oblique, lower jaw somewhat prominent.

Scales 35 in lateral series; 13 between second dorsal and anal fins. Nape and upper part of opercle covered with small scales. Cheeks with series of minute warts.

D. VII - 11, fins lower than body depth and rays of second gradually longer posteriorly; A. 10; caudal somewhat pointed; none of pectoral rays silk-like.

Yellowish in spirits, with very indistinct darker markings, many scales with a shining pearl-colored spot.

Length not given. (Günther.)

China.

(Midd. Oost-Java), vol. 23, p. 9, 1850.
— Günther, Cat. Fish. Brit. Mus., vol. 3,
p. 42, 1861 (copied). — Bleeker,

Depth 6 in total length; head 5, width $1\frac{1}{2}$. Eye 5 in head, at second fourth in head length, equals interorbital; mouth cleft oblique, extends partly below eye; teeth moderate, outer row enlarged, and ^{curved} canine on each side of lower jaw.

Scales 30 in lateral series; small on occiput.

D. VI - I, 11 (Günther in quoting Bleeker gives but 10 dorsal rays), fins lower than body depth; A. I, 10, ~~second dorsal~~ (Günther gives but 9 anal rays); second dorsal and anal acute; caudal obtusely rounded, length 5 times in body length; paired fins each $6\frac{1}{2}$.

Body green, with many bright green spots. Each scale of side with a single brown spot. Second dorsal, anal and caudal variegated with black. Caudal with brown basal spot superiorly. Pectoral green, other fins brownish. Length 85 mm. (Bleeker.)
East Indies.

915

Gobius chulae (H. M. Smith)

Vaimosa chulae H. M. Smith, Journ.

Siam Soc. Nat. Hist., vol. 8, no. 4, p.

260 ^{Pl. 23, lower fig.}

June 30, 1932 (type locality,

^{Gulf of Siam}
Koh Samui) — Fowler, Proc.

Acad. Nat. Sci. Philadelphia, vol. 89,

p. 251, fig. 262, May 19, 1937 (Tachin).

— Swatti, Index Fish. Siam, p. 156, 1936
(reference).

Depth 5; head $3\frac{2}{5}$, width $1\frac{1}{2}$.
Snout $5\frac{1}{5}$ in head; eye $4\frac{1}{8}$,
greater than snout, twice bony
interorbital; maxillary reaches
back

little behind hind eye edge, length $2\frac{1}{2}$ in head; mandible included in upper jaw; single row of very small, simple, curved, short, conic teeth along front edge of upper jaw, visible when mouth is closed; front of mandible with 4 large strong conic teeth, and set off near middle of each mandibular ramus several other rather large teeth; tongue adnate in front to floor of mouth, appearing rounded; interorbital width low, depressed, Gill opening lateral, extends forward opposite hind preopercle edge.

Scales $24 + 3$ in median lateral series; 7 transversely between dorsal and anal origins; 11 predorsal scales forward to eyes. Opercles scaly, muzzle, cheeks, interorbital and under surface of head nubsed. Row of minute close set papillae on suborbitals, close to eye, 3 parallel horizontal rows on cheeks, and row along each lower face of mandibular ramus. Small scales on chest and

breast, belly and caudal base also (918)
scaly. Scales with 15 parallel
slightly converging basal striae; 47
apical denticles; circuli fine.
D. V—I, 7, I, second spine $1\frac{3}{4}$
in head; second dorsal height
 $1\frac{1}{4}$; A. I, 7, I, fin height $1\frac{1}{2}$;
caudal I, convex behind; least
depth of caudal peduncle $2\frac{1}{8}$;
pectoral $1\frac{1}{3}$, rays 15; ventral
I, 5, with even, entire membranous
border in front, fin $1\frac{1}{2}$. Vent
little nearer anal origin than tips
of depressed ventrals, papilla
flattened, pointed, $\frac{1}{2}$ of eye.

Pale brown, each scale on
body with dark basal pocket, and
6 ill defined dark saddle like
blotches down middle of back,
with 5 still paler alternating blotches
axial along side. Head with various
dark spots. Iris gray. Jaws dotted
with gray and branchiostegal region
with blackish gray. Ventrals dorsal
with gray brown, large blackish
blotch on last 2 membranes. Second

dorsal pale, with 5 dark longitudinal bands. Caudal grayish with 5 darker transverse bands and black spot, about size of pupil at bases of upper rays. Pectoral pale, dusted with brownish, and blackish blotch above and another below basally. Ventral rather dark gray, outer border whitish.

Siam. R. M. de Sclauense.

A. N. S. P.

One, 41 mm., Tachon, known by its coloration, obtuse muzzle, large scales and fin formula. It somewhat resembles V. piapensis Herre from the Philippines, but with greatly larger mouth and different coloration.

that in the latter the head
is longer and the eye larger. In
its mode of coloration this
species has some resemblance
with Cryptocentrus octofasciatus
Late Regan.

Gobius cliffordpopei Nichols

924a

Gobius cliffordpopei Nichols, Pinner.

Proc. Zool. Soc. London, no. 175, p. 5, Sep. 25, 1925.

Type locality, Tungting Lake, Hsinan.

Depth $4 \frac{7}{10}$; head $3 \frac{2}{5}$. Snout $3 \frac{1}{2}$ in head; eye 5, superolateral, close together; maxillary reaches to under front of eye, length 2 in head; mouth somewhat oblique, jaws equal or lower, slightly projecting; lips thick, ^{no canine teeth} interorbital 4 in eye I. Gill membranes joined to sides of breast under or behind preopercle edge.

Scales 28 in lateral series. One dorsal naked.

D. VI or VII - 9, longest spine $1 \frac{7}{10}$ in head, longest dorsal ray $1 \frac{4}{5}$; A. 8, longest ray 2; caudal $1 \frac{1}{2}$, bluntly pointed; pectoral $1 \frac{1}{3}$, reaching beyond ventrals, but not to front of anal; ventral 2.

Broad black cross-bands posteriorly, somewhat variable in width.

Length 34 mm. to caudal base. ^{921b}
(Nichols.)

China. Said to differ from
Gobius hadropterus (Jordan and Snyder)
in the slightly projecting lower jaw,
and broad conspicuous vertical
bands on the sides.

101, fig. 28 (Honolulu).

Muraena steindachneri Günther, Journ. Mus. Godeffroy, vol. 9, pt. 17
1910, p. 417 (Hawaiian Is.).

Depth $4\frac{1}{2}$ (figure shows 4); head $2\frac{2}{3}$ (figure $2\frac{3}{4}$). Snout $5\frac{3}{4}$ in head from snout tip; eye $3\frac{2}{3}$ (figure $3\frac{1}{3}$), greater than snout, separated by very narrow shallow groove; maxillary reaches $\frac{1}{2}$ in eye (figure $\frac{1}{3}$, length $2\frac{3}{4}$ in head; mouth cleft well oblique, lower jaw slightly protrudes (figure shows it the same level with lower pupil edge); in each jaw an inner band of villiform teeth, and an outer regular row of slightly enlarged, acute, slightly curved teeth; tongue large, fleshy; subopercle much larger than opercle. Gill rakers small, weak.

Scales ^{ctenoid} 23 or 24 in lateral series; 5 or 6 transversely; extend forward far as eyes on predorsal (on figure only far as preopercle), and head otherwise naked.

D. VI-I, 9, first spine $1\frac{5}{6}$ in total head length, first branched ray 2, eighth branched ray $1\frac{1}{2}$;

A. I, 9, first branched ray $2\frac{3}{5}$; eighth ^{ray} branched ray $1\frac{1}{2}$; caudal 2 in rest of fish, long, pointed, supra-median rays longest; least depth of caudal peduncle 3 in total head length; pectoral $1\frac{1}{5}$, rays 23; ventral rays I, 5, fin $1\frac{2}{5}$ in total head length. Anal papilla long, slender (not shown on figure).

Color in life transparent gray, with 7 brown bright yellow cross bands not quite reaching middle of abdomen. Gills showing through gill cover as bright pink spot-blotch. Second dorsal and caudal fins, pinnules black and white like a feather. Anal with broad dark brown. Ventrals blue. Yellow-cross bands fade in spirit.

Length 10. to 12 mm. (like ad.)

Off Hong Kong, China, to 10.

1936 (reference).

Depth 6 in total length; head $4\frac{1}{2}$, obtuse convex, width $1\frac{2}{3}$. Eye 5 in head, advanced in head, less than eye diameter distant from one another; mouth cleft curved, reaches below front of eyes; teeth fine, upper outer series enlarged and conic, lower jaw with 2 lateral curved canines.

Scales 30 in lateral series.

Scales on occiput small.

D. VI- I, 11, first dorsal lower than body depth and males with second and third spines produced in filaments; second dorsal and anal pointed; A. I, 10; caudal obtusely rounded, length 5 in body; pectoral $6\frac{3}{4}$, rays \pm , 17; ventral rays I, 5, length $5\frac{3}{4}$ in body. Anal papilla conic, elongate.

Color of male with body green, sides with 4 or 5 longitudinal series of bright yellowish-green spots. Bright blue humeral blotch. First dorsal fin clear hyaline, base brownish. Second dorsal blackish, with white spots and red margin. Caudal

greenish yellow, with brown basal spot above, upper end golden, lower end brown. Anal and ventral violaceous. Pectoral green.

Female with dorsal and pectoral fins green, caudal and anal with lower edges white, and ventrals whitish.

Length 108 mm.

(731)

Depth $4 \frac{1}{5}$; head $3 \frac{3}{4}$. Snout $3 \frac{3}{4}$ in head; eye $3 \frac{3}{4}$, very close together, maxillary reaches below front eye edge; mouth cleft oblique, jaws equal; teeth in several rows in each jaw, in outer row enlarged and curved, with large, recurved, posterior canine on each side in lower jaw; tongue strongly notched; interorbital space a mere ridge.

Scales about 26 in lateral series. Whole fish covered with large thin scales, in 3 rows on preopercle. D. VI, I, 11, longest spine of first dorsal $1 \frac{1}{3}$ in head and equals longest ray of second dorsal; A. I, 10, little higher than second dorsal, longest ray equals head; caudal rounded, $\frac{1}{4}$ times longer than head; pectoral equals head; ventral very long, equals caudal, tips reach anal.

932

dull yellowish gray, with 6
dusky blotches - along side, 3 or 4
distinct black dots at caudal
base, black band from eye to
middle of throat, some scattered
black specks over body, and
indistinct, dusky, dorsal cross-
bars. First dorsal grayish with
several scattered dusky spots and
10 black dots on lower part of
fin. Second dorsal grayish, front
part with faint, darker cross-
bars. Anal peculiarly checkered
with round black and white
spots. Caudal grayish, with
numerous indistinct brownish
dots and several larger distinct
black spots on lower half of fin.
Pectoral gray. Ventral gray, with
black margin.

Length 45 mm.

(Seale.)

Philippines, Mindanao.

Gobius delagoae Barnard

Gobius delagoae Barnard, Ann. South
African Mus., vol. 32, pt. 2, p. 62, fig. 3
(head), March 1937 (type locality,
Duyack Island, Delagoa Bay).

Depth $6\frac{2}{3}$; head $4\frac{1}{2}$. Snout $5\frac{4}{5}$ in head from snout tip; eye $3\frac{1}{2}$, greater than snout, greatly exceeds interorbital; maxillary reaches below front eye edge, length $3\frac{1}{3}$ in head. from snout tip; teeth in narrow bands in both jaws, outer ones somewhat enlarged and single enlarged curved canine on each side of lower jaw; tongue truncate in front; mouth cleft inclined, begins in front level with lower edge of pupil; interorbital very narrow, 4 in vertical eye diameter. Gill rakers reduced. No flaps on shoulder girdle. Scales 5.5 in lateral series; 16 transversely. Scales cycloid, those on hinder part of body feebly stenoid. Two irregular horizontal rows of papillae below eye on cheeks; 2 close set parallel

rows along preopercle edge, with ^{933b}
lower extended forward along lower
side of mandible; postocular line
back to suprascapula; vertical line
anteriorly on opercle, and shorter
median horizontal line.

D. VI - I, 13, first spine 2 in
head, fifth twice long as first
and extended in filament; A.
I, 13; caudal lanceolate, half as
long again as head, middle rays
filamentous; pectoral rays 19,
upper not silk like; ventral reach
to vent, almost to anal.

Pale brown with darker mottling,
somewhat vermiculate on head, blotchy
on body. Body with oblique dark
bands running from above down-
wards and forwards; first band
broad, behind pectoral, followed
by 2 narrow bands, then a broad
one ending below at vent, then one
narrow, one broad, one narrow,
last between middle of soft dorsal

933c

and middle of anal; narrow
bands composed of 2 dark stripes
with pale interval; broad ones of
3 dark stripes. Two dark stripes
between eye and upper jaw. Dorsal
with a few small black spots.
Anal dark gray, middle rays of
ventral and caudal blackish.

Length 75 mm. (Barnard.)

Delagoa Bay, Portuguese
East Africa.

Illovo Rivers; Durban).

Gobius dewaali Gilchrist, Marine
Investig. South Africa, vol. 1, p. 131,
1902 (reference).

Depth $4\frac{1}{4}$; head $3\frac{1}{2}$. Snout shorter than eye; eye 4 in head; mouth subinferior, extending to beyond vertical of posterior border of eye; teeth biserial, with curved canine on each side of lower jaw; interorbital region very narrow.

Scales 26 in lateral line series; 10 transversely. Head naked, except on gill cover.

D. II, I, 9; A. I, 9; caudal rounded. Ventral reaching vent.

Color yellowish brown, with large dark brown spots, forming a zigzag band on each side. Dorsal and anal with irregular dark spots. Deep black spot on hinder third of first dorsal.

Length 40 mm.

Attal.

938

Depth 3 to $3\frac{1}{2}$ in males, $3\frac{3}{5}$ to $4\frac{1}{2}$ in females; head $2\frac{4}{5}$ to $3\frac{1}{5}$ in males, $3\frac{1}{10}$ to $3\frac{1}{3}$ in females. Snout $3\frac{1}{4}$ to $4\frac{1}{10}$ in head in males, $4\frac{1}{5}$ to 5 in head in females; eye 4 to $4\frac{4}{5}$, greater than interorbital; maxillary reaches opposite hind eye edge or often much farther; in females mouth much smaller or maxillary usually reaches just back of front eye edge, rarely to middle of eye; mouth oblique, terminal, jaws equal; outer teeth of upper jaw slender, curved, enlarged, in short row, followed by 3 rows of minute teeth; lower jaw with 4 rows of very small slender teeth at forward end, reduced in number laterally, inner row much enlarged & posteriorly, others disappearing; interorbital $\frac{1}{2}$ to $\frac{4}{5}$ of

eye diameter.

Scales 28 to 30 in lateral series; 8 transversely, 10 predorsal. Body covered with large ctenoid scales, slightly smaller and cycloid above opercles, extend forward on predorsal to eyes, anterior scales in midline behind eyes enlarged. Opercles covered with large cycloid scales and preopercles naked. Pectoral bases and breast scaled.

D. VI—I, 7, fins well separated, first dorsal height 2 to $2\frac{1}{2}$ in head, in males second dorsal with fifth and sixth rays $1\frac{1}{2}$ to $1\frac{4}{5}$; A. I, 7, fifth and sixth rays $1\frac{4}{5}$ to 2; in females dorsal and anal usually equal, $1\frac{4}{5}$ in head; depth of caudal peduncle $1\frac{4}{5}$ to $1\frac{9}{10}$ its own length in males, $2\frac{1}{10}$ to $2\frac{1}{5}$ in females; caudal $1\frac{1}{10}$ to $1\frac{1}{3}$ in head; pectoral $1\frac{1}{5}$ to $1\frac{2}{5}$, then,

pointed, scarcely reaching above⁹⁴⁰
anus; ventral thin, broad,
equals anal in length, never
reaching anus.

In Alcohol varies from dark
brown or blackish to pale
yellowish, with black or dark
brown spot on shoulder,
followed by row of 8 or 10 closely
spaced, more or less poorly
defined dark spots which continue
back to caudal base. In males
sides and underpart of head
strewn with white spots or small
irregular lines and bars. In
females they show indistinctly or
are absent. Top of snout and
interorbital dark brown. Small
circular dark spot on posterior
part of upper margin of eye. Fins brownish
or dusky. First dorsal with broad clear
band across middle and upper margin also
clear. Second dorsal and anal with 3 clear crossbars.
(Herre.)

Length 17 to 45 mm.
Philippines.

941

Remarks. This interesting and handsome little goby enters the group typified by Vaimosa Jordan and Seale. It differs from all the species associated in Vaimosa by Herre, not only in contour and coloration, but also in the large scales which do not exceed 22 or 23 in a lateral count. The extended first dorsal of my species greatly exceeds the length of the head and reaches well into the middle of the second dorsal fin. Its large eye greatly exceeds the snout or the narrow infraorbital. Quite characteristic in the variegated color pattern is the pair of dark or black spots at the caudal base, one above the other. In appearance it would seem to approach closest to Gobius dispar Peters.

Gobius durbanensis Barnard

Gobius durbanensis Barnard,
Ann. South African Mus., vol. 21,
pt. 2, p. 815, Oct. 1927 (type
locality, Durban Bay).

Mugilogobius durbanensis Fowler,
Proc. Acad. Nat. Sci. Philadelphia,
vol. 86, p. 495, Nov. 6, 1934 (False Bay,
North Greenland).

depth 5 to $5\frac{1}{4}$; head $3\frac{2}{5}$ to $3\frac{2}{3}$, width $1\frac{1}{3}$. Snout $3\frac{1}{2}$ to $4\frac{2}{5}$ in head; eye $3\frac{1}{4}$ to $4\frac{1}{5}$, much greater than snout, equals interorbital; maxillary reaches $\frac{1}{4}$ in eye, length $2\frac{1}{2}$ to $2\frac{2}{3}$ in head; mouth width $2\frac{1}{2}$ to 3; teeth minute, in narrow bands in jaws; tongue truncate; interorbital level. Gill opening exposes wide isthmus, without fold across.

Scales 33 to 35 in axial lateral series from above gill opening to caudal base and 3 or 4 more on latter; 11 transversely at soft dorsal and anal; 17 or 18 predorsal scales forward opposite middle of eyes; muzzle naked; opercles and postocular

region scaled; breast and belly completely scaly. Several longitudinal rows of papillae on cheek. Scales with 11 or 12 basal parallel striae; 15 to 17 apical denticles; circuli coarse.

D. VI - I, 7, I, third spine 2 to $2\frac{1}{5}$ in head, last ray $1\frac{2}{3}$ to 2; A. I, 6, I, or I, 7, I, last ray 2; least depth of caudal peduncle $1\frac{4}{5}$ in its length or 2 in head; caudal $1\frac{1}{8}$ to $1\frac{1}{4}$, rounded or convex behind; pectoral $1\frac{1}{5}$ to $1\frac{2}{5}$, upper rays not silky; ventral $1\frac{3}{5}$ to $1\frac{3}{4}$.

Pale brown - generally, back with rather coarse deeper reticulations leaving 2 or 3 longitudinal rows of pale round spots. Muzzle grayish. Dusky blotch on opercle. Two dark

947

spots at caudal base. Dorsals,
anal and caudal with grayish.
Paired fins pale. Iris gray.

953

Depth $4 \frac{4}{10}$; head $3 \frac{1}{3}$. Snout $3 \frac{3}{4}$ in head; eye $4 \frac{1}{3}$, $1 \frac{1}{8}$ in snout; maxillary extends $\frac{1}{2}$ in eye, length 3 in head; mouth low, but little inclined from horizontal, jaws equal; each jaw with 3 rows of small, simple teeth, fixed and subequal, palate smooth; tongue rounded. ^{interorbital greater than eye} in front; top of head flat, ^{eye} impinging on upper profile of head. Gill opening wide, with broad interspace between. Shoulder girdle without cutaneous flaps.

Scales 36 to 46 from behind middle of pectoral to caudal fin; 13 transversely between soft dorsal and anal. Head naked, without raised glandular ridges or barbels. Predorsal scales extend laterally forward above opercles, leaving naked median space to first dorsal

954

spine. Breast, chest, prepectoral and postaxillary region of pectoral naked. Scales mostly cycloid, finely ctenoid behind pectorals, smallest anteriorly and largest on caudal peduncle.

D. VI 9 or 10, fourth spine $2\frac{1}{2}$ in head, third ray 2; A. 8 or 9, seventh ray $2\frac{1}{8}$; caudal $1\frac{1}{5}$ convex behind; least depth of caudal peduncle $2\frac{1}{4}$; pectoral rays 13, fin $1\frac{1}{3}$ in head; ventral $2\frac{1}{8}$, rays I, 5. Anal papilla half of eye.

Light brown, with 6 darker cross bars on back, which white with others on sides, leaving whitish interspaces between. Head mottled with brown. Dark bar on cheek from below eye. First dorsal dark brown, blackish posteriorly, with broad white intramarginal

band. Second dorsal brown, ⁹⁵⁵
with darker mottling, margin
white. Anal brown, margin
white. Caudal with irregular
rows of dark spots. Pectorals
more or less brown, with
lighter basal bar.

Length 25 to 58 mm. (McCulloch.)

South Australia.

Gobius erythrops (Jordan and Seale)

Chaenogobius erythrops Jordan and Seale, Bull. Bur. Fisher., vol. 25, p. 404, pl. 37, fig. 3, 1905 (1906)
(type locality, Pago Pago, Samoa).
Fowler, Mem. Bishop Mus., vol. 10, p. 414, 1928 (type).

Depth $5\frac{1}{2}$; head 3. Snout $3\frac{3}{4}$ in head from snout tip; eye 3, greater than snout, little premedian in head length, and impinging slightly on upper profile of head; maxillary reaches $\frac{1}{4}$ in eye, length $2\frac{1}{2}$ in head from snout tip; teeth mouth begins nearly level with lower edge of pupil, lower jaw protruded in front; teeth in jaws uniserial, anteriorly little larger, also few on vomer but none on palatines;

957

front end of tongue with median notch.

Scales 41 in lateral series.

D. VI - 9, third spine $2\frac{1}{6}$ in total head length, second ray $2\frac{1}{5}$; A. 7, second ray $2\frac{7}{8}$; caudal $1\frac{4}{5}$; least depth of caudal peduncle 4; pectoral $1\frac{3}{4}$, rays 14; ventral I, 5, length $1\frac{9}{10}$ in total head length. Anal papilla $1\frac{3}{4}$ in eye.

Whitish, with scattered gray to dark gray dots over body. Fins largely uniform. Samoa.

U. S. N. M., no. 51781. Pago Pago, Samoa. Bureau of Fisheries. Length 14 mm. Type.

Martin, Depart. Agric. Comm. Manila,
Tech. Bull. 6, p. 236, 1937 (reference).

Depth $3 \frac{2}{3}$ to $3 \frac{4}{5}$; head $2 \frac{4}{5}$ to 3, width $1 \frac{1}{4}$ to $1 \frac{2}{5}$. Snout $4 \frac{1}{2}$ to $4 \frac{3}{4}$ in head from snout tip; eye 3 to $3 \frac{1}{5}$, greatly exceeds snout or interorbital; maxillary reaches opposite front eye edge, length 3 in head from snout tip; teeth above biserial, pointed, outer larger, similar below; tongue truncate in front; interorbital width 2 in eye, narrow, deeply furrowed. Gill opening extends forward until nearly below hind eye edge.

Scales 25 in lateral series; 12 transversely; 12 predorsal forward to eyes. Cheeks and opercles scaly. Postocular line of papillae back to suprascapula; horizontal row close along lower eye edge and another on lower part of cheek; line close along above maxillary; line along edge of preopercle and forward on each lower face of mandible; vertical line on front part of opercle and another short horizontal line below.

D. VI - I, 10, third spine $1 \frac{2}{3}$ in total head length, first branched ray $2 \frac{1}{5}$; A. I, 9, first branched ray $2 \frac{1}{3}$; least depth of caudal peduncle $2 \frac{2}{5}$; caudal $1 \frac{1}{3}$, convex behind; pectoral 1, rays 21; ventral rays I, 5, fin $1 \frac{1}{6}$ in total head length.

In alcohol brown, with 10 transverse darker bands, subequal in width with pale interspaces. Vertical fins dark gray. Paired fin gray.

Hawaiian Islands, Fiji.

(963) width $1\frac{1}{3}$ to $1\frac{1}{5}$.
Depth $3\frac{7}{8}$ to 4; head 3 to $3\frac{3}{5}$,
snout $3\frac{1}{3}$ to $4\frac{1}{2}$ in head from
snout tip; eye 3 to $3\frac{2}{5}$, greater
than snout, eyes very close set;
maxillary reaches $\frac{1}{8}$ in eye, length
 $2\frac{2}{5}$ to $2\frac{7}{8}$ in head from snout
tip; mouth oblique, begins in
front level with lower eye edge,
lower jaw slightly protruded;
teeth above in 3 rows, outer
row enlarged, lower teeth biserial
also outer row enlarged; inter-
orbital narrow, with eyes invading
upper profile of head.

Scales 25 to 27 to caudal
base and 2 or 3 more on latter;
9 or 10 transversely, 10 to 15 pre-
dorsal forward to eyes. Few
small scales on opercle above.

D. VI, I, 11, I, third spine 2 in
total head length, soft dorsal
height $1\frac{3}{4}$ to 2; A. I, 10, fin

height $1\frac{4}{5}$ to 2; caudal $1\frac{1}{8}$, convex behind; least depth of caudal peduncle $2\frac{1}{5}$ to $2\frac{3}{5}$; pectoral $2\frac{7}{8}$ to 3 in fish without caudal; ventral $1\frac{1}{8}$ to $1\frac{1}{2}$. Anal papilla conic, $\frac{1}{2}$ of eye. (964)

Dark brown, with 12 narrow white transverse band, entirely encircle body, and each with dark bordering line. Four bands on head, 3 on trunk and 5 on tail with last one on caudal base. Vertical fins dark gray brown, paired fins whitish.

East Indies, Philippines, Riu Kiu, Japan, Melanesia, Polynesia, Hawaii.

Gobius farcimen Jordan and Evermann

Gobiopterus farcimen Jordan and Evermann,
Bull. U. S. Fish Comm., vol. 22, p. 205, 1902
(1903) (type locality, Hilo, Hawaii);
op. cit., vol. 23, pt. 1, p. 482, pl. 59, 1903
(1905) (type). — Fowler, Occas. Pap.

Bishop Mus., vol. 10, no. 7, p. 389, 1923
(Honolulu); Mem. Bishop Mus., vol.
10, p. 399, 1928 (Honolulu).

Jordan and Seale, Bull. Bur. Fisher.,
vol. 25, p. 407, 1905 (1906) (reference).

Gobius farcimen Imiyama, Jap. Journ.
Zool., vol. 7, no. 1, p. 61, 1936 (Kominato;
Misaki).

Zonogobius boreus Snyder, Proc. U.
S. Nat. Mus., vol. 36, p. 605, 1909
(type locality, Misaki, Kanagawa);
vol. 42, p. 442, pl. 59, fig. 3, 1912.
(type).

Depth 5; head $3 \frac{1}{4}$, width $1 \frac{3}{5}$. Snout 4 in head measured from upper jaw tip; eye 3, greater than snout, 3 times interorbital; maxillary reaches opposite eye, length $2 \frac{1}{2}$ in head from snout tip; teeth fine, in narrow bands in jaws, outer row slightly enlarged, one each side of mandibel forward especially larger; tongue moderate, depressed, truncate, free in front; interorbital narrowly concave. Gill rakers $2+4$, minute points, less than short gill filaments, which barely $\frac{1}{3}$ of eye.

Scales 25--2 in median lateral series; 9 scales transversely at soft dorsal and anal origins; 8 predorsal scales forward to eyes. Scales large, firmly adherent, in even longitudinal rows, little smaller on caudal base, and apparently few or absent from head. Scales with 7 basal radiating striae; apical denticles $18+17$; circuli fine basally, laterally coarser.

D. VI--I, 10, second spine $1 \frac{7}{8}$ in total head length, first branched ray 2; A. 9, eighth ray $1 \frac{2}{5}$; caudal $1 \frac{1}{8}$, convexly rounded behind; least depth of caudal peduncle $2 \frac{1}{2}$; pectoral $1 \frac{1}{4}$; ventral $1 \frac{1}{5}$. Anal papilla well developed.

Pale brownish generally, under surface whitish. Sides with 6 narrow dusky lines, all along lower side variegated by as many dull obsolete blotches. Some obsolete or pale dusky streaks on head, as several broken blotches on cheek. Sides of head sprinkled with minute dusky dots. Dorsals,

anal and caudal pale with dusky blotches, as 4 transverse rows of more distinct blackish blotches on caudal. Pectoral pale. Ventral with median area dusky and darker basally, edge whitish all around.

U. S. N. M., no. 50654. Hilo,
Hawaii, July 17, 1901. U. S. Fish
Comm. Length 27 mm. I though
simply identified as "Drombus"
I believe this specimen to be the
type of Gobiopterus farcimen
Jordan and Evermann. It was
originally catalogued with the
above number and later reentered
as U. S. N. M., no. 78088, and
drawn by Mrs. E. C. Starks.
The original locality label is
in my own handwriting.

Zoologist, vol. 6, pt. 2, p. 123, Jan. 14, 1930 (reference).

973a

Depth nearly 6; head $4\frac{1}{2}$, higher than broad. Snout obtuse, convex, much longer than eye; eye nearly 7 in head; maxillary extends to vertical of front edge of eye; mouth cleft oblique, jaws equal; teeth of outer series enlarged; canine tooth on each side of lower jaw; interorbital width less than eye diameter.

Scales 35 in lateral series; 10 transversely between second dorsal and anal. Head and nape naked.

D. VI - I, 10, fins equal in height and lower than body, second, third and fourth spines highest and end in very fine short filaments; A. I, 10; caudal rounded, length 5 in total; none of pectoral rays silk like; ventral reaches nearly to vent.

Color in spirits brown, with darker spots. Head with some indistinct darker dots. Bluish band, edged with lighter, from maxillary to lower part of pectoral

9734
root. Dorsal fins with a transparent
margin, anterior brownish, posterior
with oblique blackish lines. Upper
half of caudal with brown crescent-
shaped dots between rays. Anal
and paired fins blackish. Pectoral
with base of lighter color and
with 2 blackish spots, produced
by bands described.

Length 97 mm.

(Günther)

Arombus whitleyi Fowler, Mem. Bishop
Mus., vol. 11, no. 5, p. 362, fig. 1931
(type locality).

995

Depth 5 to $5\frac{1}{2}$; head 3 to $3\frac{1}{5}$,
width $1\frac{2}{5}$ to $1\frac{1}{2}$. Snout $3\frac{3}{4}$ to
4 in head; eye $3\frac{1}{4}$ to $3\frac{3}{4}$,
greater than snout or interorbital;
mouth little inclined, with
snout tip well below level of
eye, jaws about equal, and
mouth cleft extends $\frac{1}{2}$ in eye,
length $2\frac{1}{3}$ to $2\frac{1}{2}$ in head;
teeth conic, firm, rather strong,
close set, curved, biserial, at
least in front of jaws, and
medially rather large tooth in
each mandibular ramus, curved
back; tongue fleshy, with median
notch in front forming two slight
lobes; interorbital narrow,
bony width $\frac{1}{4}$ to $\frac{1}{2}$ of eye.
Gill opening lateral, restricted,
with broad isthmus.

996

Scales 31 or 32 + 2 in lateral axial series; 12 transversely. from soft dorsal origin; 6 predorsal forward to occiput, imperfect or appear as if fallen in most young, whole region to eyes variably more or less scaly with age. Head otherwise entirely naked. Papillae little developed or evident on head in young. Row along each mandibular ramus, back along and up close behind preopercle edge. Chest and breast scaleless, also prepectoral region. Scales smallest anteriorly on body, or crowded, larger on tail and posteriorly.

997

D. VI - I, 9, second spine $1\frac{4}{5}$
to 2 in head, first branched
ray 2; A. I, 8, fin height 2;
caudal $1\frac{1}{8}$ to $1\frac{1}{4}$, rounded
behind; least depth of caudal
peduncle $2\frac{2}{5}$; pectoral $1\frac{1}{5}$ to
 $1\frac{1}{4}$, 4 of upper rays detached
and free; ventral $1\frac{1}{4}$ to $1\frac{2}{5}$.

One example. Dumuring Point,
Masbate. Shore. April 19, 1908.
Length 34 mm.

Two examples. Reef opposite Cebu,
Cebu. April 5, 1908. Length 13 to 41
mm.

Two examples. Maricaban Island,
Luzon. Shore under stones. June 20,
1908. Length 67 to 82 mm.

One example. East side of
Tagbalaran Strait, Bohol
Island. April 9, 1908. Shore
seine. Length 60 mm.

One example. Mahinog, Camiguin
Island. From fishermen. August 3,
1909. Length 53 mm. Quite dark in
color.

Two examples. Mahinog, Camiguin
Island. Tide pools. August 3, 1909.
Length 42 to 50 mm.

Two examples. Balayan Bay,
Ligbo Point, Luzon. January 18,
1908. Shore. Length 45 to 49 mm.
Smaller with swollen snout.

999
One example. Little Santa Cruz
Island, Zamboanga. May 26, 1908.
Length 43 mm.

Three examples. Mactan Island.
August 28, 1909. Length 43 to 45
mm.

Twenty seven examples. D. 5147.
Sulade Island (E.) N. 3° E.,
8.40 miles (lat. $5^{\circ}41'40''$ N.,
long. ~~117~~ $120^{\circ}47'10''$ E.), Sulu
Archipelago, vicinity of
Liasi. On 21 fathoms.
February 16, 1908. Length 20 to
51 mm. [III.]

U. S. N. Mus., no. 72280. Aua,
Tutuila, Samoa, Bureau of
Fisheries. Length 35 to 47 mm.
Four examples.

U. S. N. Mus., no. 71401. Naha,
Okinawa, Ryū Kyū Islands, Japan.
Albatross Expedition 1906. Length
28 to 55 mm. Twenty-two examples.
As mapo crassiceps.

Two examples. Simalue Island,
tide pools. September 22, 1909.
Length 50 to 54 mm.

shima Island, Japan. Bureau
of Fisheries. Albatross Expedition
1906. Length 38 to 70 mm. Ten
examples.

U. S. N. M., no. 88040. Benkoelen,
Sumatra. December 19, 1925. Length
34 to 37 mm. Two examples.

Gobius galwayi (McCulloch^{10/4}
and Waite)

Ingillogobius galwayi McCulloch
and Waite, Records South Austral.
Mus., vol. 1, pt. 1, p. 50, pl. 3, fig. 1,
May 24, 1918 (type locality,
Pattawalunga, near Adelaide,
South Australia). — McCulloch,
Austral. Mus. Mem., no. 5, pt. 3, p.
376, Nov. 28, 1929 (reference).

(1015)

Gobius gemmeus (Herre)

Gnatholepis gemmeus Herre, Gobies
of Philippines, p. 135, pl. 9, fig. 3,
1927 (type locality, Samal Island,
in Davao Gulf, Mindanao);
Sitambai; Dumaguete; San Juan,
Siquijor); Journ. Pan-Pac. Res.
Inst., vol. 8, no. 4, p. 10, 1933
(Dumaguete); Fish. Herre Philippine
Exped. 1931, p. 82 (1934).
— Roxas and Martin, Departm.
Agric. Comm. Manila, Techn. Bull.
60, p. 232, 1937 (reference).

Depth 4 to $4\frac{3}{5}$; head $3\frac{1}{2}$ to $3\frac{7}{10}$.
Snout 3 to $3\frac{2}{5}$ in head; eye $3\frac{4}{5}$
to 4, $1\frac{3}{5}$ in snout, greatly
exceeds interorbital; maxillary
reaches almost to front eye edge,
length $2\frac{2}{5}$ in head from snout
tip; mouth cleft oblique, small,

1016
begins in front slightly below ^{level of} lower ~~the~~ eye edge; upper teeth in 2 rows, curved, depressible, preceded by 1 or 2 pairs of long, slender, inward-curved canine like teeth on either side of median line of jaw; lower teeth biserial, outer row of 10 or 12 large wide spaced teeth, ending in pair of backward curved canines; inter-orbital narrow, $3\frac{1}{2}$ in eye, which nearly enters upper profile of head.

Scales 25 to 27 in lateral series; 10 transversely, 10 predorsal, with nape narrowed, almost ridge like. Cheek and preopercle scaled, also pectoral base. Body with loosely attached, large, ctenoid scales, denticles easily rubbed off so scales may often appear cycloid. No papillae or grooves on cheek.

(1017) to 1⁷/₁₀.

D. VI - I, 11 or I, 12, third spine 1¹/₄
in head, fin height 1¹/₃ to 1¹/₂;
A. I, 11, fin height 1²/₃; caudal
3¹/₆ in rest of fish; least depth
of caudal peduncle 2¹/₄; pectoral
1¹/₈; ventral 1¹/₈.

In alcohol dark yellowish
brown to very pale yellowish
brown. Along sides 6 broad dark
cross bands, posterior ones large,
circular spots in young specimens;
each band margined by wide
stripe of pearly white. Breaks
up with age, so longitudinal
rows of pearly white spots formed
along sides. Narrow dark brown
stripe passes vertically through
eye and down across cheek;
sometimes crossed by 1 or 2 short
transverse lines. Longitudinal
faint brown line passes across
middle of opercle and on across
pectoral base, where darker.

1018

Preopercle, opercle and pectoral bases with large circular pearly spots. Hape and sides below dorsal dotted with small dark brown spots. First dorsal crossbarred by brown and white spots; near base of sixth spine circular blackish brown spot and paler one on basal part of fourth spine. Second dorsal rays dusky, with brown up and down streaks more or less developed on membrane. Anal crossed by 2 rows of large, conspicuous circular black spots, alternating with white. Dark brown spot on caudal base, followed by several blackish spots, rest of fin more or less cross-barred by small brown spots. Pectoral cross-barred by small brown spots. Ventrals dusky or speckled with brown, or gray, with dark brown margin.

Length 25 to 45 mm. (Herre.)

Philippines.

Ctenogobius platycephalus (not Richardson)
Jordan and Evermann, Proc. U. S. Nat.
 Mus., vol. 25, p. 362, 1902 (Kotosho;
 Taihoku; Formosa).

Depth $4\frac{1}{2}$; head $3\frac{1}{4}$ to $3\frac{1}{3}$. Snout $2\frac{2}{3}$ to $2\frac{4}{5}$ in head; eye 4 to $4\frac{2}{3}$, $1\frac{2}{3}$ to $1\frac{3}{4}$ in snout, greatly exceeds interorbital; maxillary reaches $\frac{7}{8}$ to eye, length $2\frac{3}{4}$ to $3\frac{1}{5}$ in head; mouth low, little inclined with jaws subequal or lower slightly shorter; upper lip wide, width $\frac{2}{3}$ of eye; teeth biserial, small, outer brow above little larger, and no canines; interorbital narrow, concave, eye entering upper profile of head. Gill rakers $2 + 8$, small points.

Scales 28 or 29 in lateral series; 9 or 10 transversely. Predorsal scales not quite extending forward to eye, where cycloid. Head otherwise naked, also prepectoral region. Scales on breast small, or appear absent due to thick epidermis.

D. VI - I, 7 or I, 8, third spine 2 in head, second branched ray 2; A. I, 7 or I, 8, first branched

10206

ray $2\frac{1}{8}$; caudal $1\frac{1}{4}$ to $1\frac{1}{3}$, rounded or truncate; least depth of caudal peduncle $2\frac{9}{10}$ to 3 ; ^{none detached} pectoral $1\frac{1}{5}$ to $1\frac{1}{4}$, rays 18 to $20\frac{1}{2}$; ventral rays $7, 5$, fin $1\frac{1}{5}$ to $1\frac{2}{5}$. Anal papilla $\frac{1}{3}$ of eye.

Pale olive, brown or grayish. Along middle of side row of 6 blackish blotches, usually larger than eye. Alternating on back as many dark saddle like blotches. Narrow dark or blackish band from middle of side of maxillary to lower front eye edge. Predorsal mottled with darker. Dorsals with gray black spots, as 3 rows on first fin longitudinally and 4 on second fin. Caudal with gray vertical bars. Membranes of ventrals gray black. Fins otherwise pale.

China, Formosa, Korea and Japan. Length to 120 mm.

Gobius goldmanni Bleeker, Nat.
 Tijds. Ned. Indie, vol. 3, p. (161) 167,
 1852 (type locality, Timor Kupang);
 Ned. Tijds. Dierk., vol. 1, p. 271, 1863
 (Timor).

Gobius punctillatus Rüppell, Atlas
Reise Nordl. Afrika, Fische, p. 138,
1828 (type locality,

Gobius albopunctatus Valenciennes,
Hist. Nat. Poiss., vol. , p. 57, 1837
(type locality,
Sauvage, Bull. Soc. Philom.
Paris, ser. 7, vol. 5, p. 106, 1881 (Swatow).

Gobius kreftii Steindachner, Sitzb. Ber.
Akad. Wiss. Wien, vol. 53, pt. 1, p. 451,
1866 (type locality, Port Jackson).

Depth 6, body elongate, anteriorly cylindrical, posteriorly compressed; head $4\frac{2}{3}$, obtuse, convex, width $1\frac{2}{5}$. Snout obtuse, shorter than eye; eye 4 in head, advanced, close to opposite eye; mouth oblique, reaches below eye, upper jaw strongly protractile, lower jaw little protruded; teeth pluriserial in jaws, outer row enlarged; lower jaw with 2 lateral curved canines.

Scales 28 in lateral series; predorsal scaly forward to eyes. Postocular groove prominent.

D. VI - I, 10 or I, 11, last spines and rays lower than body depth and obtuse, and second dorsal angular and higher than body; A. I, 9 or I, 10, angular behind, lower than body; caudal obtuse, rounded, length $4\frac{2}{3}$ in body; pectoral rays 19; ventral rays I, 5; paired fins subequal, 5 times in body length. Anal papilla conic.

Color of body olivaceous above,
below paler. Back and sides
above with bright-occluded black
spots. Sides below with several
transverse bright-brown. Ventrals
reddish, with black spots.
Caudal and paired fins reddish
olive. Anal brown in front,
yellow posteriorly with black
margin.

Length 63 mm.

(Bleeker.)

Timor Kupang.
